

Edgar Mayer · Thomas Mehner

Zeitbombe Jonastal

**Das Dritte Reich und die Nuklearwaffe.
Gefahren im Boden.
Das gelöste Energieproblem.**

A glowing yellow and orange atomic model with three elliptical orbits is positioned on a dark, mechanical, and somewhat futuristic-looking device. The device has various components, including what looks like a control panel with buttons and a small screen. The background is dark and textured, with some light reflecting off the device's surfaces.

Note: For this book, sources from the internet, among other things, were evaluated or used. Since the World Wide Web (WWW) is in part a "transitory medium", it may happen that Internet links are subject to changes or even deleted. The authors therefore ask for your understanding if dedicated readers who are looking for the sources given here do not always find what they are looking for. In any case, the authors made a backup copy of the Internet references in question so that they can be verified in case of doubt.

*»A cynic is someone who has not yet lost faith
in the evil in people.«*

Ron Kritzfeld

foreword

Since the publication of our last book so far - *And they had them!* - as far as a follow-up project is concerned, unfortunately much more time has passed than was actually planned. Work overload, personal turbulence and other adverse circumstances contributed to the fact that we had to put the project of a new book on hold, for which we would like to ask our interested readership for indulgence and understanding.

When reviewing the documents and written information, some of which we had to select for the work that is now before you, we also had to realize with dismay that there is now so much material that a meaningful compilation hardly seems possible. So what to do? Well, we decided to start with picking out a few aspects that seemed important to us for the current project - to present a collection of information, so to speak, that should be understood to supplement/update our previous books.

Updates, so to speak, if you want to choose a term from the Anglo-American language area for the sake of brevity. Some of these presentations are brief, while others are more detailed.

An overall presentation of the topic »German high technology« or something that is particularly important to us Individual aspect »nuclear bomb«/»special weapons with high "Release of energy" in a single work is according to ours opinion is not (or no longer) possible, especially since a consideration of these two aspects alone would fall short, as they are related to the (sometimes secret, i.e. remained unknown) activi-

ok

doings of numerous individuals as well as the existence of numerous underground facilities that were scattered across the entire Reich. The whole thing has meanwhile advanced to become a very complex topic, so that one can probably only pick out individual aspects.

Over the years we've received a lot of mail from our readership asking, among other things, for more detail on things we sometimes only hinted at. So far we have been able to do this

We can't fulfill my wish, but we have thought about it and will try (we don't want to promise anything) to tackle this project. To do this, however, we need to change our approach. If we have the necessary time, we will work through our archives piece by piece over the coming years, that is: we will try to present a multi-volume collection of everything that has been collected over the past 20 years, especially since we think so that for all interested readers, including some researchers, some information that has been dormant in our files so far could be of use. And there are quite a few of them. We want the whole - and this should be expressly emphasized at this point - including the work in front of you, to be understood as **a combination of non-fiction book and personal experience** report, which allows us to also publish things that are in a normal non-fiction book or in a source-related one Processing usually cannot be accommodated appropriately, which includes, for example, experiences at meetings, information on site inspections and the processing of an extraordinarily extensive correspondence (with a lot of important and eye-opening information).

Wherever the protection of sources and our word of honor require it from us, we will carry out anonymization; where we believe that the whole thing can now be omitted, we will disclose the sources. In addition, we still have a few reports in which contemporary witnesses and/or other researchers provide us with information about theirs

Experienced or known revealed. Sometimes we were authorized to publish these more or less completely, but in some cases we were also informed that, for example, the names of those involved were not to be mentioned or only by giving the first letters of the first and last names. As has been the practice for years, we will adhere to these guidelines, even if it sometimes drives our critics mad.

As a reminder: As stated in our previous book, we see our task above all in "pointing out contradictions and > curiosities < that should never exist in a coherent historiography - especially not in relation to the nuclear (weapon) for research during the Second World War, about which it is said that the Americans could do everything, but the Germans could do nothing. We also still stand by our statement, which reads: »Other researchers and seekers of truth

will then sooner or later follow certain tracks we have laid (or develop our own search strategies), which logically can also imply that at some point they will pass us by cognitively. We take it easy: It's about the thing, and we're happy about everyone who makes progress in this. After all, the truth is what matters and every effort should be justified." That doesn't mean that we're willing to let anyone who thinks they need to spy on us certain sensitive information. The motto is that you only

achieve your goal through your own work and effort. We are happy to give advice, sometimes in detail, but we will make sure that the wrong kind of people - of whom there are more than you would think at first glance - are not supplied.

Having made that clear, we would like to point out that in the event of any future presentations, the only criterion according to which we will prepare the information is the chronological order, supplemented by a few overviews of topics that are of particular interest to us.

Anything else makes little sense, as you would have to allow at least two years' lead time to tackle a project prepared according to other criteria. But you can only do that as an author supported by a patron or as a

Private individuals can afford, if at all. That is, we will begin our account somewhere around the year 2000, hoping to make it to the end, which is by no means certain. Cross-references will be given where appropriate, and of course we will cite sources where necessary. Of course, repetitions in this project cannot be avoided, because for reasons of completeness some things will have to be discussed again in detail. We don't think that's a problem, especially since all of our earlier books are out of print and we've received inquiries from numerous interested parties over the years as to how and where they can still be obtained (not all of our readers have an affinity for ternert and are on the go on eBay or online antiquarian bookshops or able to pay high double-digit prices for certain titles).

However, we are not only going this route to fulfill the wishes of numerous readers and to master the amount of information, but also for other reasons.

With a few exceptions, all those who worked closely with us from the beginning in Germany and Austria have died in the past five years - and some of them were far from being of an age when such events are expected. Such caesuras can be managed if they occur once or twice in the specified period. But when the loss of someone important is "they die like flies," then one becomes pensive and changes one's mind on a number of issues, including whether what we've published - let's just be general formulate - could initially lead to certain irritations and at some point perhaps to the undermining of the credibility of the representations of establishment history and thus of the prevailing political system. (One reason why some of our very early collaborators, in anticipatory obedience after realizing what was at stake, stopped their work or put their information in a vault.) We're not exaggerating on this, as we still have the statement of one thing in the ear of a former high-ranking officer in the Ministry for State Security (MfS) of the long-defunct GDR, who years ago asked us how we got hold of the large amount of individual information, and let us know that as early as the 1970s, those who were aware of the Events in the Thuringian Jonas Valley and its surroundings were informed, it was clear »that the topic could overthrow entire governments«. For this reason, as we learned from the gentleman, but not only from him, the MfS employees who worked on the subject until the end of the GDR in 1989 were ordered to a specific location in the old federal states after the so-called reunification, where she was an employee of the foreign secret service BND,

who is also active at home when it comes to national security problems, and threatened them that if they tried to publicize something about what they had done professionally, they would get into serious trouble (um to paraphrase that carefully). The name of the gentleman from the BND and his telephone number at the time have been sent to us. To be on the safe side, we passed both on to other, trustworthy contemporaries.

A brief digression: The reader must now know -
we have mentioned this elsewhere -,
that in the 1970s the Russians informed a select group of those responsible for the state security of the GDR that during their investigations after the war they had found four facilities in the area of the military training area in Ohrdruf or in the area around Arnstadt, in which parts of the German atomic bomb had been built became. However, it was not possible to determine where the final assembly took place. The MfS people didn't want to believe the whole thing at first, this information seemed too detached to them.

Nevertheless, the Russians called it correct.
(end of digression)

In view of such machinations, as we have just mentioned with regard to the BND, it should now be clear to even the most naïve under the sun why the representatives of the Federal Republic of Germany - in contrast to those of the GDR - do not have the slightest interest in clarifying this special topic (especially not involving the public), just as little as they are interested in looking for war-related relocations, for example. Has one ever heard of the fact that the Federal Republic of Germany authorities were looking for the amber room?

Have you ever heard that after value deposits,

which were created up to the end of the Second World War, was looking for? The GDR authorities did both. However, not the German ones. (Of course: there were a few tentative efforts in Thuringia or in the area of the new federal states in the post-reunification period, but these quickly fizzled out.) Isn't that strange? Strictly speaking, yes, but you always have to consider the following: Those responsible for the FRG, as staunch vassals of the USA, will do a hell of a lot to take care of things that lie hidden underground and, if they are found, may cause embarrassment in the form of documents, which contain information that torpedoed the historical picture of the winners. It doesn't matter whether a Barack Obama or a Donald Trump is in power in the USA. The presidents are anyway

only figureheads that can be exchanged at any time, that of the deep state, of the actual power structures in the form of the military-industrial complex, the secret services, the financial structures (banksters), the foreign influence organizations and the (criminal) structures controlled by this conglomerate that are needed, to get obstructions out of the way.

Some of those who have left us have collected important things, often in private, which we will be able to present in the future thanks to the partial takeover of their material collections. What does the world know, for example, about secret underground research during the Second World War in the area of Geistingen (today: Hen nef [Sieg; "City of 100 Villages", NRW])? The supposedly all-knowing Internet *encyclopedia Wikipedia* has no information on this. It only reports on the catastrophic Allied bombing raid on the town at the end of the war and its consequences:

»On March 8, 1945, the center of Geistingen was destroyed by 208 four and a half hundredweight bombs. the to The attack cost 44 lives (civilians and foreign forced labourers), and the church was destroyed. [...] Just one day later, the Americans appeared in Geistingen and engaged in a battle lasting several days with German units on the northern bank of the Sieg.«

So far, no one has asked, at least publicly, for the true reasons for the heavy bombing and the Americans' interest in what is actually a completely meaningless community. Strange. Or not, if you know what it's about. This area was of enormous importance with regard to top-secret investigations, first by the Reichspost and later by the SS in matters of high technology.

These had been in operation since the mid-1920s and at that time still related to basic research, but at the latest since the beginning of the war they had the character of a smaller SS think tank, in which work was carried out on certain future weapons-related projects, for example in the form of beam weapons for infantry use (es even gives a photo of a corresponding weapon test) or a twin-beam Vi. In addition, at least one reactor was installed in the area, the location of which was given to us and which was seen by eyewitnesses whose reports we have. The difficult thing is that it was installed in the basement of an object that the SS had confiscated and which previously belonged to a specific structure, although Himmler's Schutzstaffel was not concerned with the building itself.

* See <https://de.wikipedia.org/wiki/Geistingen> (accessed April 26, 2019). Also: <http://www.general-anzeiger-bonn.de/incoming/Bomben-richten-in-Geistingen-ein-Infemo-an-article93069.html> (accessed April 27, 2019).

but just about those basement areas that, as we heard, were additionally expanded in depth. Revealing the location could cause significant turmoil today, and we have to reconsider whether there's any point in revealing the details. It is unclear whether the reactor is still there or whether it was dismantled towards the end of the war (which is unlikely given the fact that it is said to have been running).

The prototypes developed there were later mass-produced throughout the German Reich - also in Thuringia.

Oddly enough, at least to the best of our knowledge, all representations of German nuclear and high-technology research, even those of a Dr. Rainer Karlsch and Heiko Petermann, nothing reports that Geistingen was an important part of these activities.

The sole purpose of the bombardment at the end of the war was to eliminate this underground think tank, and the Allies' accuracy was an absolute catastrophe: instead of eliminating the secret facilities in the Geistingen Forest (which would have been almost impossible due to their underground facility anyway), one was created hit a defenseless and defenseless village - typical of those who tried to make up for a lack of class with mass.

And so, like hardly anyone else from Geistingen, his environment and the associated importance for German secret weapons research and development, it is the same with regard to other locations. (Or has any of the establishment historians ever heard of the production

written for a long-range rocket at the Hanomag company, whose segments were captured by the British?) The areas of Thuringia, Saxony, Saxony-Anhalt or Bohemia-Moravia that have been cited in this regard so far are only part of what actually existed. Some may never

become known, and since those who knew about it have long since gone to a better world, the future is likely to bring many a (radiant) surprise. Not only in Germany and Austria, but also in the Czech Republic, Slovakia, Poland, Norway, Russia and, and, and.

But sometimes you don't have to look far when the "good" is so close: In our last book to date, we showed pictures of a sinkhole that was registered in the 1980s and its exploration at the Ohrdruf military training area (Thuringia). , who reduced to absurdity the official (Bundeswehr) talk that »there was nothing« underground. As luck would have it, shortly thereafter we received a collection of notes from a gentleman who was well informed about certain things going on at the time and had kept a kind of diary about them. This was the icing on the cake, so to speak - and we will have to present some additional information derived from it in the future. Because of that, there is nothing! Sometimes we can only marvel at the audacity with which the FRG officials spread untruths. But as is well known, these have short legs, so that at some point they end up lying open, and in this context we are only surprised that some former military training area commanders still fit their pants at all.

Of course we are aware that due to the style we cultivate, which is admittedly sometimes irreverently cynical (cynics see things as they are, not as they should be), we have few friends - at least among the officials and the official ones appointed historians. (Although we would consider it a personal shame if our opponents and critics praised us.) It

there were also some people who were definitely on our side who thought we should report in a more factual, more reserved form. However, we say: A rough wedge belongs on a rough block. The decades of lies, distortions, manipulations and suppression of information are absolutely unbearable. What is the use of factual («serious») representations that are incorrect from the back (or front and back), that hide numerous aspects and only serve the purpose of cementing the manipulated view of history cultivated by the former Allies, especially the Anglo-Americans?

Right: only to those who have cultivated their German hatred since time immemorial. With such people we do not have the least in common. On the contrary: their masks have to be torn off their faces, their lies have to be unmasked and that part of the story has to be told that has so far remained under cover or has received little attention. Anyone who is halfway informed should also know that the Federal Republic's leadership "elite" is strictly transatlantic and will do everything possible to maintain the victors' view of historical events. German atomic bomb? Impossible! Only the great Americans could do that! We say: no way, they just couldn't do it, because they had neither enough bomb material nor a working detonator.

The Germans put class against quantity - and therefore won the race for the nuclear weapon.

Incidentally, we are obviously guilty of a particular crime: years ago, we publicized an issue that certain circles active in this country - let's paraphrase it like this - are investigating "through official channels" because of its sensitivity and finding a solution wanted to. Of course under exclusion

the public, since it is evident that the circles of the "elite" still believe that all people who do not belong to their illustrious circle are stupid and can be manipulated. For example, someone complained that the understanding to be awakened for objective historical research (in relation to the German atomic bomb and the aspects associated with it) above the local military level, i.e. in Thuringia, had decreased extraordinarily, which was due to years of disastrous work by Mehner and Co. could be attributed ...

Interesting. fateful? For whom? For those who wanted to take the small official route? (Which would never work anyway due to the complexity of the topic.) If we look at the past 20 years in this country, we only know of one disastrous development: that of Angela Merkel's chancellorship with the Islamization of Germany she pushed ahead with and the establishment of a GDR 2.0.

By the way: Do you really think that any higher levels in the Bundeswehr (better: in the Federal Ministry of Defense) or in other ministries would tackle the topic of the »German atomic bomb« - and in a way that was (at least) close to the truth? Well, such a belief is a joke in that in this country the representatives of the higher military

Not only do they all look intently in the direction of the USA (so the Americans will hardly be presented with uncomfortable facts), but they are also opportunists who probably stand to attention and put their hands on their trouser seams even when they are not being watched.

One has searched in vain for people like General Reinhard Günzel for years. Although one thing is interesting: Even in the FRG-German military circles you have nothing from that

Learned World War II. If at that time there was still military resistance - no matter what it was - it is nowhere to be seen today. Those responsible supported the transformation of the Bundeswehr from a (defence) army of Germany to an externally controlled NATO task force without any objection. If there were even a hint of conscience, decency, a sense of responsibility and a sense of truth, the Bundeswehr would not be in the state it is in today. Instead of the top military officers blowing the whistle on their mistress Ursula von der Leyen (which a military officer should actually be able to do), they go along with every stupid thing without objection - the main thing is that the pay is right and the future pension is not jeopardized. The Bundeswehr (which can hardly be called "-wehr" given the shambles of the troops) is only on the road on behalf of supranational interests: in Afghanistan, Mali and probably soon in Venezuela. We'd bet that it would be done within half a day if its actual task, namely national defence, was taken care of. However, this does not prevent the Federal Defense Minister from joining the chorus of those who provoke Russia around the clock. It used to be: Big flap - nothing behind it. Irrespective of this, it should be remembered that many have already lost their teeth in Russia: Napoleon's Grande Armée failed just as terrifically as Adolf Hitler's Wehrmacht. Obviously, the resulting German 1945 knockout wasn't enough - and they're trying again. We wish you every success and a series of eye-opening insights!

As for the gentlemen in the higher military leadership ranks and still do not seem to have understood elsewhere is that in the age of the Internet

before wanting to solve sensitive problems behind closed doors are doomed to failure in far more cases than before. And that's a good thing, because the representatives of the so-called elite are anything but philanthropists, but often enough conceited, corrupt individuals who only think about their own personal advantage, who deserve our full contempt because they despise us too.

Incidentally, there is a reason that »people from the masses« were provided with the sensitive information regarding a German nuclear (weapons) program and not the Federal Ministry of Defense or the local historians. Ever thought about it?

As you know, we don't think much of secrets

Kraemerei, although we are of the opinion that for research-related reasons some information

have to wait longer for publication. We also believe that now is the time again to present some of this "parked" information.

Since these are often items that can be assigned to so-called "oral history", we have deliberately pointed out a few pages earlier that ~~we are not presenting and persons also experienced reports~~ (including those of the eyewitnesses) want to be understood, since this form of presenting information is better suited to our concerns. We let the eyewitnesses speak (with all the subjective elements they contain) and are aware of the fact

* »Oral history is a historical method based on letting contemporary witnesses speak. The contemporary witnesses should be influenced as little as possible by the historian. In particular, people from various milieus should be able to present their living environment and perspectives for posterity in this way.« (Definition according to *Wikipedia*, https://de.wikipedia.org/wiki/Oral_History [accessed on May 2, 2019].)

aware that there are sometimes worlds between what they report and what the established historians say, true to the motto that the contemporary witness is often the worst enemy of the historian, who likes to see himself as a scientist and believes to be in possession of the truth, which, however, has often enough turned out to be an error.

In addition: If these eyewitness accounts had not existed years ago, a discussion about the actual status of German nuclear (weapons) research would probably never have started. Instead, contemporary historiography would, as in the past, proceed from what the Allies had established on the subject - and, in our opinion, that is not the truth.

Certainly: we can be sure that some contemporaries will again accuse us of base motives and claim that what we present cannot possibly be true, because *established* contemporary historiography clearly assumes that the German Reich is not capable of developing a nuclear weapon. Let them do that, these guys aren't our friends anyway (and we're lucky they won't be either). Ultimately, the old principle also applies here: many enemies, much honor - a principle to which we stand, especially since we consider the modernist, anti-creation gossip about the equality of human beings to be intolerable because it is incompatible with the facts and also typical Masonic ideas. So the thoughts of those who, like the US President and High Degree Freemason Harry S. Truman, attracted attention with their particular moral dealings:

the use of atomic bombs against innocent Japanese civilians. Before they were deployed, he deceitfully declared: »But we don't drop the bomb on women and children. We are a civilized nation.«

“The German is like the slave who obeys his master, without chains, without a whip, by the mere word, even by a look. The bondage is in himself, in his soul; worse than material slavery is spiritual slavery. You have to liberate the Germans from within, nothing helps from the outside.”

Heinrich Heine*

* Heine's works in five volumes, Volume 4: *Thoughts and ideas*, Chapter 4, Aufbau-Verlag, 13th edition, Berlin 1974. See also <https://gutenberg.spiegel.de/buch/gedanken-und-einfalle-381/4>

Introduction

The Federal Republic of Germany faces a bright future in the truest sense of the word. - No, not what you think: Our statement has nothing whatsoever to do with an economic and financial boom, a better quality of life or a multicultural society that we all love, as preached by the "elites" as positive, contrary to natural law will to do. In any case, all of this is pure illusion in the face of an incompetent and corrupt administrative and political "elite" operating in this country, which is ultimately nothing more than a lackey of high finance.

Rather, the »radiant« means someone here in the future GAU (biggest accident to be expected) to be expected in Germany, i.e. an event of a nuclear nature which, uncontrolled, will hit the FRG from one day to the next and radically change it. And no, it has nothing to do with the well-known nuclear reactors that once secured the energy supply in this country.

For years we have been trying, as we did last time with the DVD *Secret Matter German Atomic Bomb*, to draw attention to the fact that there are things under the ground in Thuringia, but also in other federal states, that should have been recovered decades ago, but because of the secrecy that continues to this day remained there on the part of the former Allies, as well as across-the-board political inactivity, ignorance and mendacious contemporary historiography,

* See: <https://www.kopp-verlag.de/Geheimsache-Deutsche-Atom-bombe.htm?websale8=kopp-verlag&pi=959200>

where they were stored at the end of World War II: German nuclear and other second-generation retaliatory weapons and the necessary enrichment and production facilities.

The official statement on these our for years The indications presented (about the existence of the second generation of miracle weapons and the associated underground systems) is, of course, that such statements should be classified under the rubric of "crazy and conspiracy theory" and that the area of the Thuringian Jonas Valley has no nuclear history whatsoever, because yes - and that is, unbelievably, presented as evidence - that history has never reported such things, but instead it is common knowledge that only the Americans possessed an operational nuclear weapon at the end of the war. However, such statements made by establishment historians and officials are not worth the paper they are written on and are becoming less and less consistent with the facts, especially since the fact that for the last 20 years there has been a great deal of contradiction that has arisen due to general resistance to facts but stubbornly ignored.

Beginning in 2001, we had compiled a long chain of evidence in a series of books showing that the historiography of German nuclear (weapons) research contains a large number of gaps, omissions and contradictions. In our books *The Secret of the German Atomic Bomb* and *The Atomic Bomb and the Third Reich*, we listed numerous testimonies that contradicted the previous picture of the non-existence of a German atomic weapon, and backed it up in our books *The Americans' Fear of the German Atomic Bomb* and *The Lies the allies and the*

German miracle weapons with the series of documents from US archives, which had often been released after decades of secrecy and torpedoed the previously widespread representations in history books.

In the meantime, for around 20 years we have been on the trail of those developments that were pushed forward on the German side during the Second World War in order to achieve the so-called final victory, but due to sabotage and betrayal, mixed with a portion of do-gooderism that was already present in this country at that time, not used - with fatal consequences for the defeated Germans.

If one speaks and writes about these things nowadays, the whole thing seems to be a long time ago - without relevance for those alive now. history. But this impression is deceptive: the things that were once hidden from Germany's enemies by being transported to bombproof underground hiding places will eventually cause problems - problems that cannot be solved with normal firefighting or ammunition recovery operations . If what lies 30, 50 or even 100 meters underground one day proves its presence, there should be no holding back in this country. This "wake-up call of a special kind" will lead to a reshuffle of the cards, which for a nation that is showing signs of decadence in the highest degree and whose inhabitants are subject to the effect of induced insanity in no small number (which has been known at least since the year 2015 can clearly see), can actually only be evolutionary.

Of course, we cannot currently say when this GAU will occur - whether in 10, 20 or more years. What we can say, however, is that some of the reactors that were operated underground during the Second World War are currently

natural material decomposition and fatigue processes of their safety devices are lost. This happens, for example, in those systems that lie deep below Kienberg, which lies between Luisental and Crawinkel. (The Americans discovered one of them at the end of the war and blew it up, but they didn't get anything from the rest due to a lack of knowledge.) But the stored nuclear weapons will also become a problem at some point.

We are quite aware that after reading the previous paragraphs at the latest, our critics will once again scream clamor and murder, true to the motto: How can Mayer and Mehner trumpet such claims out into the world?

Well we can. In the past few weeks, as a kind of review of events, so to speak, we have looked on the World Wide Web to see what has been written and asserted over the past 10.15 years on the subject of the »German atomic bomb« and the associated subject areas . While our opinion is unequivocal and clear (the German Reich had nuclear weapons and was already testing the first long-range delivery systems for their transport, at least in the form of prototypes), other opinions and comments, how could it be otherwise, ranged from friendly approval to blunt disapproval (Not to mention insults and personal attacks; some contemporaries even wanted to end our earthly existence "when the opportunity arose").

While some thought that decades after the war, a small part of the truth was finally coming to light, others said that Mayer's/ Mehner's descriptions (as well as those of some other authors) were, quite literally, rubbish. as dr Rainer Karlsch and Heiko Petermann years ago with their book *Hitler's Bomb*

came onto the market, they were attacked in a similar way, whereby the accuracy of the sources was criticized in particular. However, the two gentlemen did not get the really big sledgehammer. He was supposed to hit us - but he didn't because we didn't give a damn about the critics. Of course, we took note of their arguments (there is always something to learn), but did not adopt them as our own.

We can't resist mentioning that the discussion culture observed in the relevant Internet forums was often not culture at all, but can only be described as uncultured. Sometimes it got up

beat each other up as much as they could, and one could be thankful to the creator that the opponents did not face each other personally, because otherwise blood would have spilled. Of course, these special kind of theater events made an impression on newcomers or outsiders (readers) - but not a good one. Some people who had particularly impressive experiences in this regard passed them on to us afterwards. We have the whole thing - around in the picture

from page 28, second line from the bottom - archived under the category »Hazardous waste«. Perhaps future historians will want to look at the material if they want to write a doctoral thesis on the research focus »Induced insanity of FRG Germans at the beginning of the 21st century«.

Speaking of historians: these also occasionally had their say in the Internet forums, although there were certain characters who obviously didn't like each other at all, which was not only noticeable in the tone of the debates, but also in the personal slurs. One of the gentlemen seemed to be a special friend of a professional colleague too

be. He therefore tried several times to get hold of the originals of the so-called Wachsenburg protocols (we are only talking about these here) in our possession in order to use them for a special kind of attack. The problem:

Contrary to all historians' assumptions, these did not come from the city and district archives of Arnstadt or from the stocks of the Birthler authority, but from another source known only to us. Somehow these papers had to be extremely important, after all a letter was even addressed to one of us in which money was offered for the minutes. Even if a positive evaluation of the documents might have brought us some benefit, we ignored the offer. We do not interfere in the arguments of the so-called experts, but instead enjoy the priceless amusement that is offered in this context.

Let us make one small addition: If we hadn't received and published the Wachsenburg Protocols and other things years ago, hardly anyone would have known anything about the events that took place in Thuringia at the end of the war. Nobody could argue with other contemporaries about the subject, nobody could jump out of their skin and suspect their counterpart of »forgery« or »manipulation«. Well, ingratitude is the world's reward. However: We take it easy and continue as before.

In all the years that followed the publication of various books by us, our critics repeatedly vehemently claimed that there had never been a (small) nuclear test at the Ohrdruf military training area in the area of the so-called triangle. The only strange thing is that a later investigation found traces of slightly enriched uranium and cobalt 60 there - as well as those to be expected typical glazing.

It was just as vehemently asserted that the events reported in the Wachsenburg minutes could never be correct - certainly not the effects described there in relation to nuclear radiation of the population living in the vicinity of the military training area. The only strange thing is that we have now received further testimonies from people who were directly or indirectly involved in the detonation of the test weapon and who reported effects that suggest a radiation effect. Did they all succumb to some kind of mental illness?

A word of advice: newcomers to the topic should try. If you want to form your own opinion from all the assertions and counter-assertions that have been published in the meantime, it will be a very difficult undertaking. The fronts - and there are not just two - are hardened, each side insists on its "truth". Before you suffer a nervous breakdown or become a psychiatric case, we recommend, according to the British, to wait and see what happens and to drink tea. That which does not exist will one day appear and, according to our justified (cynical) hope, above all to the critics and know-it-alls

ruin health.

What is generally forgotten again and again is that The fact that the German secret weapon developments of the time, especially those of the second generation, were either completely adopted by the Allies after the end of the war and kept secret so that the Germans learned nothing about them, or that what was once on their underground had waited for use, remained untouched and is still awaiting discovery today - or, if it is not found soon, will speak up in a clear form.

Over the years, well-meaning individuals have asked us why we would actually do this to ourselves. Of course, we knew from the beginning that in a country that is subject to the history of the Allies and in which the re-education of the Germans has been successful (another assessment would ignore reality), there is hardly a chance of falling on open ears. The happy slaves vehemently defended their enslavement, not realizing that they were being put on the very course that the Allies, and particularly the Anglo-Americans with their plutocracy, intended for them. They are subject to external control. Luckily, since 2015 more and more people who have been living in this country for a long time have recognized what this system is worth: the organic German counts for nothing, the tax pennies he has laboriously earned are sunk in pointless projects, while he himself has more and more problems making ends meet come. Of course, this does not apply to everyone, but the number of those who have economic and financial worries is growing steadily.

In view of such conditions, one should ask why the German is not considered valid in his own country. Intelligent people are to be expected to be able to answer for themselves, the others may sleep on. The problem lies in our recent history: the Germans once taught the Anglo-American plutocrats to fear - and they still have one today

tremendous fear that this could happen again.

That is why everything is being done across the board to prevent Germany from going its own way (which is expressed, among other things, in intensive cooperation with Russia could) or to keep the Germans down in general (by the way, a well-known and declared goal of the

NATO*) - which of course also means that we must never learn the truth with regard to certain (contemporary) historical events.

A few years ago we even presented documents in this connection, from which it was evident that, for example, the Americans a) were thinking long before the end of the war about how they could re-educate the Germans, and that after the war b) they were given important documents withheld according to the motto: If you don't have all the information, you won't be able to draw the right conclusions either.

The reaction to that? Zero! In a typical slave mentality, everything is accepted as long as the TV is on and the crate of beer doesn't cost 60 euros.

For us, however, such machinations are purely arbitrary and completely unacceptable, which is why we have always viewed everything reported by Anglo-American historians (and their German accomplices) with the utmost skepticism. It is possible that we, who fret about such conditions, belong to a dying species. So be it: And if we were the only ones who think like this - we would still articulate our opinion at any time.

* See the *Spiegel Online* article »Western Defense Alliance. On my 70th birthday - what you need to know about NATO«, which formulates immediately after the headline: »>The Americans inside, keep the Russians out - and the Germans on the ground« So outlined the first Secretary General the tasks of NATO. [...]". <https://www.spiegel.de/politik/ausland/die-nato-wird-70-was-man-ueber-das-buendnis-wissen-muss-a-1261001.html> (accessed May 2, 2019).

*"It will also be seen that there is only one way to
show your wits to fools and fools, and that is not to
talk to them."*

Arthur Schopenhauer
Aphorisms on the Wisdom of Life,
Chapter V, item 23

Strange things about the A-bomb

In the past two decades we have received some location information regarding the nuclear weapons relocations, but at the moment there is only so much to say that we did not know the exact location - i.e. to the meter - in most cases, only the approximate. In addition, such an exact location would not make much sense under the current (political) conditions, as one could observe in the past few years, using the example of the area called "Hamster", which is directly connected to the Jonas Valley, how the authorities in a downright frightening way with such a topic is avoided. After a ground-penetrating radar investigation was carried out in the area in question by a Chemnitz engineer on the basis of a tip from a contemporary witness, which was also accompanied by an exploration of the area with regard to any ferrous metal accumulations lying underground and the results obtained were of a positive nature, a danger report was sent to the responsible Thuringian authorities.

After that, nothing happened. No reaction. No request from the authorities. It was only when the report about the measured cavity and the bodies (quite [nuclear] bomb-like) stored in it went to the media that things started to move. But not, as one might expect as an inexperienced observer, to the extent that drilling was carried out in the relevant area, for example, to explore the subsoil. No, first of all, those responsible claimed that an ammunition recovery company had been commissioned with the relevant probing work and that they had no suspicions

found. To make matters worse, this statement was also publicly disseminated as a calming pill - even though the exact location of the radar and ferrous metal investigation was not known at the time.

Yes, you read that correctly: While the public had already been misled once before, the protagonists of the find report were only just asked in writing to inform the responsible authority by a precisely defined date where they had measured at all. Ergo, the officials obviously didn't have the slightest idea what they were actually talking about.

* (For the files:

* This oddity - the authorities had already measured and given the all-clear, but did not know the exact location of the Chemnitz engineer's measurement, which is why they asked him to disclose it - was also reported by the *Munich Merkur*. In the article »Nazi atomic bombs in the middle of Germany? Hobby researcher sounds the alarm" (<https://www.merkur.de/welt/speculation-on-atoms-proposed-site-jonastar-6996700.html>; last updated: May 14, 2016) reads in the last two paragraphs:

»However, experts doubt the geological investigations of the amateur researcher. An employee of the ordnance disposal company Tauber told the MDR that ground radar analyzes at a depth of more than twelve meters are not realistic. However, Lohr is not content with that. He offers to prove his technique in joint measurements. The amateur researcher is of the opinion that measurements down to a depth of around 25 meters are possible.

The Ilmkreis district and the city of Arnstadt consider Lohr's assumption to be pure fantasy. **After an examination of the site by a specialist company, the municipalities assume that there are no nuclear weapons there. Peter Lohr was asked to give the exact coordinates of the spot where he wants his ground-penetrating radar to have located the atomic bombs by May 27 [2016].«** (Emphasis added by the authors)

We have the corresponding correspondence in parts - a unique document of contemporary German history.)

Only so much more: The ammunition recovery service commissioned had not searched at the actual measurement site, but at least 120 meters away! Quite apart from that, according to everything we learned, he had no ground-penetrating radar device with which the Chemnitz engineer's results could have been checked or counter-checked. But who knows: maybe there was an employee who, by laying hands on it (on the forest floor), was able to precisely define what was underneath ...

There's no helping anyone who's wondering about the whole thing. The Germany that once stood for competence no longer exists; it has disappeared silently at least since the beginning of Angela Merkel's chancellorship.

In this country, lower mediocrity, incompetence and incompetence prevail across the board - especially where authorities are active. The main thing, however, is do-gooderism, language corridors and political correctness.

And of course today it means being afraid of climate change - in other words, paying homage to that new religion that the Reds, the Greens (Reds, painted green) as well as the Anglo-American high finance representatives (the left and ecological ideas, if they benefit them and secure trillions of dollars) have devised while sweeping the myriad components of real environmental threat and destruction under the rug. Beyond that, how one wants to master the problems of the future with a moralism that has gone completely mad is beyond our control

knowledge. But just by the way: We already met Jah

We have sharply distanced ourselves from the local (political) system, which we - we openly admit - deeply despise. We only observe the whole theater performed in this country

nor from the position of a spectator looking at an insane asylum from the outside and marveling at the peculiarities and peculiarities of the characters (better: inmates), who go crazy every day and articulate ideas and concepts that fit their whereabouts. There is more to it - at least for the moment - not

accept.

As we have already stated, we can roughly narrow down the storage sites for German nuclear weapons that have become known to us - at least in relation to Thuringia. A bomb is said to be between the towns of Zella-Mehlis and Oberhof

lay. Around 20 of them are said to have been stored in the area of the now legendary Jonas Valley, although there are several locations that indicate this. Still others were distributed over half of Thuringia and, because some of them were brought underground in a kind of emergency relocation, sometimes less than two meters below ground, so they could be brought to light in a night and fog operation. (Of course, they no longer work; the ingredients, especially in a plutonium bomb, are always »interesting«.)

There is a reason why we are talking about "should" here, i.e. the possible form: The information comes from contemporary witnesses who a) either found out about these transfer locations after the war or b) were there themselves when the German miracle weapons were never seen again disappeared under the ground. Logically, we were not involved ourselves, so we pass on the information with the necessary distance.

Of course, they see themselves as particularly critical respectable contemporaries in their well-known negations Litanei try to question such eyewitness accounts immediately and they, especially since they report on things that it

allegedly never existed as implausible. However, we don't have to worry about that, as we were very fortunate to be able to substantiate some of these statements with further aspects on the one hand and on the other hand to be able to prove at least the presence of cavities (of a natural or artificial nature) at some of the places mentioned by the contemporary witnesses through radar investigations .

The again and again - also by officials - in

allegation made in this context that the ground radar method used could never, never work

kidneys (or, in a milder form, not reaching certain depths) is simply nonsense, because several reference measurements provided very clear evidence to the contrary. But who cares in this country, when we have entered a post-factual "fake news" age for a few years now? (Facts have become uninteresting, the only thing that counts is the politically correct representation presented by government representatives and their henchmen. However, we are not interested in this government fake news.) Chemnitz radar compartment

mann, with the assistance of another expert, who used a different method to examine the Thuringian soil on behalf of the authorities, held a conversation lasting several hours to the effect that the method he used could not work. Of course, the former was not fooled, because he not only used the system, but also developed it further. So he knew exactly what he was doing. Incidentally, a few weeks later we got to know a planetary geologist who confirmed to us that the process worked wonderfully and that it was being further developed

in a twisted form when screening planetary subsoils...

In view of such facts, the question arises for us - allow us the brief digression - by the way, whether mankind should really work on artificial intelligence (AI), when the natural (human) one would have to be developed first.

Interestingly, the Chemnitz engineer's suggestion of testing both measurement methods directly on site, i.e. under real conditions, was not accepted. What were you afraid of? Or did you have no money? Well, the latter justification is completely irrelevant. In the FRG there is money for everyone and everything, as long as it benefits the realization of some outrageously expensive fantasy project or can be withdrawn from the autochthonous people living here. Take a look at the Elbphilharmonie in Hamburg, at the (disaster) airport BER, at Stuttgart 21 (those who are active there would probably never have been able to complete the secret underground facilities in Thuringia [on time]) or at the all-round supply of the Migrants: Billions play no role here. The increasing poverty in old age among the original German population, constantly rising rents (which are now even overwhelming the lower middle class), monthly contributions from private health insurance companies reaching insane levels (which are sometimes higher than the pensions of those affected by private health insurance) and the arbitrary, aggressive actions of Tax authorities against small entrepreneurs (they don't dare to go to the big ones) - none of this interests any political sow. On the contrary: it is not difficult to see that massive efforts are being made against those who once worked all their lives for the prosperity of this country - and still do. Your interests are irrelevant to local politicians; The main thing is that you can use the taxpayers' money for ultimately completely pointless projects

sink what appears to us like an undeclared new war against the Germans.

Of course, there is also no money to carry out a few target-oriented exploratory work in the Jonas Valley. Or there shouldn't be one. Apparently

some representatives of the authorities know what can be found there - and that what is to be found does not fit at all with the historical picture drawn up by the Allies.

Not to mention the effort involved: where to start with the manhunt? And assuming one finds something: Would the salvage of, for example, a nuclear weapon solve the problem of endangerment? Or do you have to keep looking?

Our answer is: Whoever Pandora's box opens, a lifelong task awaits. Not only is Thuringia riddled with holes like Swiss cheese - there is also the problem that you can never say exactly what to expect. There may even be things that you can't recover at all because you don't understand them.

As we have already pointed out in earlier books, nuclear technology was not the end of German developments, but there were post-nuclear weapon systems that went beyond this (at least in the prototype stage), for example in the form of the super explosive RADgUM or a system that was carried out by means of a rocket or an airplane could be transported to any area and dropped, remaining inactive there for a while, but then beginning its work of destruction by contaminating ever-widening circular areas from its moorings and converting all matter existing there into a specific chemical element started. The radius of action of the weapon was determined by its size, stopping the process was absolutely impossible. Would such a system

used against London, for example, there would no longer be any worries about BREXIT. The story would have been very different.

By the way: on closer inspection, the atomic bomb against the latter two weapon developments was a joke, little more than an entry into the world of miracle weapons. And the Germans pushed the door wide into this world up, very far...

At this point we would also like to point out that official announcements should not be trusted in our opinion. In Germany in particular, when it comes to »hot topics«, things are twisted beyond recognition. It has been claimed for years that the Ohrdruf military training area does not contain any unknown underground infrastructure and that all such claims by busy local researchers, technology and treasure hunters are pure speculation. However, in 2015, in our previous book *And they had them!* released recordings of a video that was made in the 1980s and showed exploratory work on and in a sinkhole - in the depths of which there were legacies from (Reich) German times that certainly had not gotten there by magic.

But that's not all. Did you know that yourself is there a bunker system under the so-called garden city (Ohrdruf)? No? Then find out about it: It was committed years ago, and the squad that was in it at the time was led by a military officer and also accompanied by civilians. However, according to one participant who couldn't (or didn't want to) keep his mouth shut, people only ventured so far into the system until the Cyrillic characters on the walls stopped. That's where the Russians apparently had their reconnaissance

canceled. Since a queasy feeling arose, the German underground safari troop mentioned above did not go any further. By the way: We have some of the names of the participants in this special kind of expedition.

And something else: We have a map that shows, for example, markings for underground facilities from the German Reich north of the village of Wölfis - and thus on the military training area at Ohrdruf. These underground installations were apparently, at least in part, cleared up by the Russians after the war and continued to be used. Officially, however, it says - you already know that -

that there is nothing. The only strange thing is that a former officer in the National People's Army (NVA) of the GDR, whom we met years ago and who was in Erfurt at the time lived, told us about his underground stays in the 1970s and 1980s, during which he had to visit these secret facilities because of his work as a liaison officer. During these visits, the Russians always wanted to make him believe that these bunkers had been built by them, but the East Germans (better: Central Germans) were not fooled, because the architectural style alone revealed who these secret systems, at least those of the NVA officer entered that had once been buried. It was the Germans, and the facilities subsequently used by the Russians belonged to what officially does not exist today.

In this context, the interested reader should finally know that the Russians were apparently only satisfied with what they found after the war for a certain period of time and made expansions in the first half of the 1950s. Despite appropriate measures, they did not go unnoticed. You can guess who was spying on her? Correct: the CIA. A

A corresponding short report was found not too long ago by a researcher in Thuringia - thanks for the tip, Alex! (But we also thank the Americans for kindly supporting our views in the form of pertinent documents and for convicting their German allies of fraud.)

The "Information Report" on "Ammunition Bunkers at Ohrdruf", which was once classified as "secret", dates from December 1953. After its release, parts of it are still censored and report:

"Since April 1953 construction work on underground bunkers has been going forward on the troop training grounds at Ohrdruf, northeast of the main center. Three Soviet trucks bring cement from the Ohrdruf railway station four times a day. Six large underground bunkers have been finished so far, and a beginning has been made in storing ammunition. The ammunition is unloaded at the railway station. It is mainly artillery ammunition of around 120 mm caliber. So there is some ammunition packed in boxes with probably is 22mm.«

* The information on the document ("Ammunition Bunkers at Ohrdruf" | Document Type: CREST [1] | Collection: General CIA Records [2] | Document Number (FOIA)/ESDN (CREST): CIA-RDP80-00809-A000500780253-2 | Release Decision: RIPPUB | Original Classification: S | Document Page Count: 3 | Document Creation Date: December 19, 2016 | Sequence Number: 253 and additional information, including links, can be found at: <https://www.cia.gov/library/readingroom/print/833567> (accessed 3 May 2019).

The document can also be accessed directly at: <https://www.cia.gov/library/readingroom/docs/CIA-RDP80-00809-A000500780253-2.pdf> (accessed 3 May 2019).

In English: Since April 1953, construction work has been carried out on underground bunkers at the Ohrdruf military training area, north-east of the main center. Three Soviet trucks deliver cement from the Ohrdruf train station four times a day. Six large underground bunkers have been completed so far and ammunition storage has begun. The ammunition is unloaded at the station. It is mainly artillery ammunition with a caliber of about 120 millimeters. There's also some ammunition that's probably 22 millimeters in diameter and packed in boxes.

On the following two pages we show a facsimile copy of the map that we received years ago from a contemporary witness or his descendants and which includes the military training area north of the village of Wölfis, as well as a facsimile of the US document. Finally, on the next two pages, we have enlarged and contrasted the interesting (highlighted) map areas so that the reader can easily see that there is a common ground that should be thought-provoking.

And since we're on the subject, it should be mentioned that Russian trucks transporting building materials were also observed on the western side of the Ohrdruf military training area by a gentleman who saw them frequently in the 1970s when they passed the village of Schwabhausen. When the Russians realized they were being watched, they changed their tactics and allowed the transports to run at night. However, they did not remain unobserved there either. What they didn't know: the man suffered from insomnia and registered the secret transport events even when others were in the world of dreams.

Map section showing the area of the Ohrdruf military training area north of the village of Wölfis. Some of the markings genes obviously indicate the location of underground facilities again, which arose up to the end of the war. (archive authors)

This report is for the use within the USA of the Intelligence components of the Departments or Agencies indicated above. It is not to be transmitted overseas without the concurrence of the originating office through the Assistant Director for Collection and Dissemination, CIA.

Facsimile of the first page of the CIA document relating to the Reported work on bunker systems "near Ohrdruf" carried out by the Russians in the early 1950s.

Comparison of the contemporary witness card and the CIA card (page 49).

Although the latter is of inferior quality, one can see in her obe

The lower third can clearly see the bunker systems that are drawn in, which can be interpreted as a kind of northern extension of the structure that is visible on the contemporary witness card. But there seems to be more. The contemporary witness card acts

It is originally a German topographical map, used as a basis for Russian reconnaissance because of its accuracy has been used. The position of underground objects, but also of some above-ground structures, was entered in it. Sometimes there are also depth indications in the form of a downward white send an arrow next to a circle and the indication »30 m«.

But back to the »bomb«. As a reminder, let's get straight to the point: In our opinion, the nuclear weapon is a German invention. The story of the successful US Manhattan Project is one of the biggest lies ever told to mankind.

As late as March 1945, the later US Secretary of State James F. Byrnes wrote a fire letter to his president, in which he lamented that the project would produce an error because not enough nuclear fuel for the bombs had yet been produced. In April 1945, US troops reached Thuringia, which they conquered and plundered, contrary to the agreement (it had finally been assigned to the Russians as a zone of occupation). In May 1945, they also took over the cargo of the German submarine U-234, which was originally intended to go to Japan and whose history we have presented in detail in our last book to date. What fell into their hands is largely unknown to this day; but it was high technology in the truest sense of the word. The nuclear technology on board the submarine in the form of enriched bomb material (we guess the uranium isotope 233), a nuclear bomb (V-3), the associated detonator and German experts, for example in the form of the detonator specialist Dr. Heinz Schlicke, for the Americans was invaluable. Suddenly all problems were

solved: The successful nuclear weapons test in the desert of Alamogordo, New Mexico, was followed by the criminal atomic bombing of Hiroshima and Nagasaki.

Speaking of Hiroshima and Nagasaki. In line with this, we received information about two years ago that at least one of the nuclear weapons that had been brought to the Pacific island of Tinian in order to prepare them for use against the two Japanese cities just mentioned had already been carried out by a

was received by the "German engineer in a white coat" who was on site. The bombs came in pieces, in wooden crates with labels on them, and were assembled under the supervision of the German expert. The inexperienced Americans obviously had - to put it in a popular way - little idea about the hooting and blowing.

Who told us the story? Well the source was an American participant who was over 90 years old at the time his information was disclosed and who was a friend of a former Peenemünde engineer after the war.

Right: Somehow this story sounds very different from what has been reported so far. It is said that the American Manhattan Project ultimately resulted in a success based on its own research and achievements, even if it had been a long, difficult road with numerous problems to be solved.

However, one should always remember that after the war, Americans had plenty of time to tell the story as they saw fit. The truth fell by the wayside - as collateral damage, so to speak - (at least partially or in the most important aspects).

To conclude this chapter, let's do some forward looking. As we foresaw years ago, the avalanche we started has picked up speed (which can only be good for us), even if the public hardly notices this in view of the 2015er migrant influx and the associated problems, which have been the subject of public discussion in this country until determine today. As we have heard, there are now other interesting eyewitness statements and

Documents have surfaced that suggest the existence of the German atomic bomb. In addition, a number of remarkable indications were found as to how the Germans approached or mastered the physical processes necessary for the production of such a weapon. (Although we or one of our colleagues already showed some basic things in earlier books, for example in relation to the corresponding technologies, the ellipsoids and the fusion weapon.) It is therefore quite possible that the truth will come out one day, although we are cautiously optimistic: we will neither be able to show all development sites nor to fully reconstruct the events. Even if the former Allies were to release all the documents available on this subject (which would be a highly embarrassing process for them and can therefore probably be ruled out), many questions would remain unanswered, because the Germans took precautions after the defeat at Stalingrad and left the most important ones. Things are disappearing underground on a large scale. Incidentally, archives are said to exist that lie deep underground, containing the knowledge that is being sought today. All events since the mid-1920s that led to the development of miracle weapons and other new technologies were recorded with German thoroughness.

Of course, if these archives could be found, they would be more explosive than any nuclear weapon.

In addition, it must be taken into account that the German Secret weapons projects were staggered in depth: The uranium association was operated at the top level, which was named after the War was very suitable for the Allies, because its activities were small and could later be untruthfully presented as "the maximum possible of German nuclear research" - which somehow sounded logical in view of one

Budgets of just over a million Reichsmarks.

(Whereby forgetting that the responsible German military initially offered to immediately [!] make 100 million Reichsmarks available.) Below this level was another level: that of the activities in which various research institutes, large German industry, but also the SS (or their secret service, the SD) were involved. Below that - and that's what's actually new, interesting and/or important - there was a third level that had numerous points of contact with the second (mainly due to the use of identical material, development and human resources), but its knowledge from other sources related to certain Ahnenerbe activities.

The latter information needs some explanation. Just this much: It is well known that there were a number of people among the leading National Socialists who were very close to the idea that a high culture had existed on earth a long time ago. Some of them even believed that it was unnecessary to invest large amounts of money in future research to solve mankind's problems. Instead, it would be better to look for the relics of the sunken early high (technology) culture(s) and use their (possibly still somewhere) conserved knowledge. Said and done. The Ahnenerbe played an important role in this, and - so we were told - everything that was discovered in this context disappeared into "bomb-proof catacombs" underground. known

also that the Ahnenerbe, which from a certain point in time was directly subordinate to Heinrich Himmler, Reichsführer SS, financed expeditions that went to Tibet or Asia. Not all were made public

known. The German expedition members were sometimes very friendly received at the destinations, for example in India, and - because it was supposedly prophesied - initiated into the knowledge of the priests, some of which was thousands of years old. (Of course, these things were also subject to secrecy.) Anyone who is only a little familiar with the ancient Indian traditions, which can be read in numerous heroic epics such as the *Mahabharata* or the *Srimad Bhagavatam*, will know that, among other things, the modes of action of so-called godly weapons were described in them - inclusive the effects they produce. The European translators of the 19th century sometimes had great problems translating the relevant passages in the heroic epics into their languages - they lacked the corresponding visual or empirical values, not to mention the terminology.

After World War I, some of what was unimaginable in the 19th century became more plausible, and Germans subsequently became interested in the subject. Let's keep it short: Some of the most advanced German weapons and technology developments have their information technology origin, at least in part, in the old (Indian) traditions.

The SS organization not only looked for Ahnenerbe in Asia, but also, for example, in the south of France. There they wanted to find the Holy Grail, of which they knew from the appropriate study of sources that it was not a chalice, but that this designation was a paraphrase for something else - namely an infinitely bubbling source of energy...

There are rumors that the Holy Grail was identified and recovered, bringing German research to an unprecedented level by 1943 at the latest -

particularly as far as power generation and weapons technologies were concerned.

In this connection, allow us a small one

Detour: There is no doubt that the ancient high cultures had amazing abilities and an equally amazing knowledge (e.g. in relation to calendar calculation, the construction of pyramids and large plants, metal production, medicine, etc.). In addition, it has been shown that the age of certain cultures must be pushed further and further back into the past; there is archaeological evidence that highly developed cultural centers of India, the remains of which now lie below sea level, once existed 12,000 years ago. And an end to this development, that is to say: the rescheduling of human civilization activities, does not seem to be in sight.

The conceited and know-it-all archaeologists and antiquarians of the 19th century, probably inspired by the theory of evolution" (you know: man descended from apes [although the first men were not the last apes]), believed that the naked biped was a steady going through upward development, according to which the primitive was at the beginning and the high at the end (thus, therefore, the civilization of the 19th century represented the ultimate). The traditions of the ancient cultures were therefore ignorantly referred to as myths (inventions, folklore) - people did not understand that these were fact-based reports from the ancestors, admittedly sometimes heavily embellished with literary elements. However, the Ahnenerbe believed very well that these "myths" had a real background - and drew the appropriate conclusions from this. (By the way: anyone who distrusts the myths of the past should always bear in mind that the historiography of the back

lying 2000 years full of lies, manipulations and distortions and should therefore be treated with extreme caution. Anyone who speaks of historical "science" is therefore completely on the wrong track. The writing of history is at best a genre of literature, sector »fairy tales and their [real] backgrounds«.)

To this day, the research community does not want to accept that earthly development, which also affects human culture, is circular or wavy: there is constant growth and decay, ups and downs, cultural development and cultural decline. No great human empire has ever endured, all of them sank into the dust of history - and that will also happen (thank God or fortunately) with such ideological and bureaucratic monster constructs as the EU. Because the »experts«, who are obviously not able to recognize the laws of nature, but do not want to accept this, they also resist the idea that there was a high culture (also scientifically and technically pronounced) on earth a long time ago may have existed, who showed abilities and skills that went far beyond ours or - because she cultivated the connection to nature much more intimately - was of a different nature. These "experts" have sometimes developed a downright hostility to such hypotheses, which, on closer inspection, however, shows only one thing: that they have not grasped the slightest thing.

We agree: The solutions to the problems of our world lie in our past - not necessarily in our future, which is highly uncertain and therefore hardly predictable. The Germans (in the form of the guiding organization Ahnenerbe) understood the natural principle very well - and acted accordingly. We

Today's people, who don't suspect anything about it and certainly don't know anything at all, in most cases of course only understand "train station" in view of such facts. Figuratively speaking, we find ourselves, together with many other almost blind people, on the march into a dark tunnel at the end of which a deep shaft awaits, which means death. The matches ran out after the first 10 meters, and after a further 20 meters the battery-operated flashlights stopped working. Nevertheless, we continue in the hope that at some point it could become light. However, given the current situation, there can only be one solution: turn around and return to the daylight. But why is nobody noticing this?

So back to the actual topic. Future accounts by other researchers may try to soften the situation of how German knowledge and developments regarding nuclear weapons could simply be "forgotten." We can only warn against this. What is needed is an absolutely ruthless appraisal that also "appreciates" the machinations of the victors accordingly. The fact is, after all, that everything that had to do with the German miracle weapon developments of the second generation was massively suppressed by the Allies - to which, among other things, document embargo periods of up to 100 years are eloquent testimony. When the victors had understood on the one hand what booty they had caught, but on the other hand they had not discovered much at all, any unhealthy curiosity on the part of any future "know-it-alls" and "contradiction" and "truth seekers" had to be prevented by everything that was somehow relevant was kept secret: discovered prototypes, design drawings, test reports,

Statements from participants and, and, and. German military officials, scientists and engineers were pressured to keep their mouths shut by having them sign non-disclosure agreements. And anyone who was considered an insecure cantonist was observed so that the wrong word would not escape his lips.

However, people make mistakes - and so some information escaped the secret mongers, as we were able to show in the previous books with many examples.

Future reports will probably also fail to ask a question that is important in connection with the German developments, namely the danger emanating from the underground facilities and their contents, which have not yet been found - i.e. what we mentioned at the very beginning. Once again: Please don't let anyone believe that the Allies found everything that once existed in the German underground infrastructure. An SS Standartenfuhrer close to Heinrich Himmler said that 60 secret installations in the Jonas Valley alone had never been discovered. That this has to be the case is shown, among other things, by the movement of the so-called guardians of the Grail in the decades after the Second World War, which would have been completely superfluous if Germany's opponents had found everything. For decades, those who were once involved regularly observed and checked certain locations for integrity - even in the days of the GDR.

Incidentally, after German reunification, some of the old gentlemen (with their successors, who usually drove them to the interesting places of their former work) showed up in Arnstadt in Thuringia, for example, from where they went on "excursions", for example to the area of Eichfeld to the west of Arnstadt (where you already

built underground bunkers in the 1930s).

Others drove into the Jonas Valley or into neighboring areas, such as: Hamster, Lämmergraben, Sonnenberg, Wüster Berg. After a few minutes that the gentlemen spent in the fresh air and true

Apparently wallowing in their memories, they left the places again - believing that everything was still the way it was once left. (Whether they suspected or even knew that the Russians had found, reused, and even expanded some facilities after 1945 is another question.)

In our opinion, the proof of a German nuclear weapons program could also have other unpleasant consequences: the assertion often made by "conspiracy theorists" that projects with numerous participants can be kept secret from the public would be confirmed - what the mass media, Of course, official and governmental conspiracy and cover-up practitioners should not be happy. For this reason alone, they will do everything they can to prevent the truth from being uncovered: by spreading mendacious reports in the media, employing so-called experts, all of whom profit from the system and fear for their livelihoods, and defaming those who do who search for the hitherto hidden things.

Some professional optimists hope that if the full truth about World War I, the interwar period, World War II, and the aftermath were to come to light, there could still be one or two "earthquakes." We don't think so, as we know from our own experience that there are (still) happy slaves who come from the deepest

conviction wanting to believe the lies, can hardly be persuaded to wake up from their deep sleep, because that would make them lose their bearings. This could only be achieved with a GAU, as we have announced for this country.

Unfortunately, the mass of people - this is to be added for the sake of completeness - have never been intelligent, have never wanted to know the truth and have never understood what is really going on in the world. On the contrary, she often pursued those who revealed the truth with great zeal.

We consider it impossible that new insights into what we have been discussing for years will interest the general public. Today's people have much more "important" problems that waste their time, such as greed for the latest smartphone or the use of other modern technologies that spy on them from early morning until late at night.

Many contemporaries now even panic if they can't "check" their e-mail for a day, and we can remember that years ago there was a survey of the younger generation to clarify the question of what whose representatives are more important: contact with a friend or their own smartphone. The result did not surprise us: Four fifths were of the opinion that one cannot do without the mobile phone, but one could do without one's fellow human beings. Similar surveys or studies provided hardly more encouraging results: In one case, young smartphone owners described the mobile phone as "their best friend".

* Since then it has been clear to us: the mass man is lost, he is useless for anything - except for his interests

* See: <https://www.horizonworld.de/studie-zeit-mit-smartphone-important-als-time-mit-people/> (accessed on April 27, 2019).

after dinner

Update 1: The small atom test Ohrdruf and secret service general Reinhard Gehlen

When it comes to the »German atomic bomb«, it is often the same as with ei a glass of beer only half full. Some say it's half empty, while others say it's half full.

The same applies to the credibility of what the Physikalisch-Technische Bundesanstalt once claimed to have gleaned from the analysis of the soil samples from the crater at the Ohrdruf military training area: namely that there would be no indication of the small nuclear test we postulated . Only the nuclide cesium 137 was found, which was probably deposited there due to the worldwide nuclear weapons tests and the Chernobyl accident in the former USSR. Of course, we knew immediately after the PTB press release that the whole thing wasn't right, front and back, which we also pointed out again and again.

On September 20, 2012, an unknown but obviously well-informed author hiding behind the pseudonym » Schattenkoenig » on the website of the *Ace of Swords* stated in the article »The German Bomb« about the facts:

»As a result of Karlsch's publication, soil investigations were also carried out at the Ohrdruf military training area until 2007 in order to test the thesis that a

nuclear weapon explosion more than 60 years ago at this point. A shallow depression 50 meters in diameter was found. Glass-like melted sand was found in this one, as it also occurred at the Trinity Test Site in New Mexico (Trinitite). Prof. Reinhard Brandt, physical chemist from the University of Marburg, also mentions the successful detection of fission products in his summary of the investigation. Although fission products were also distributed across Europe as a result of the Chernobyl reactor fire in 1986, they have a significantly different isotopic composition, so that the reason for their presence at this point is one

must be a separate >nuclear event< in which nuclear fission reactions also occurred. Nevertheless, despite all these indications, Prof. Uwe Keyser from the Physikalisch-Technische Bundesanstalt denies a clear finding - I wonder why. The academic institutions of the Federal Republic of Germany, when there is a conflict between the demand for scientific honesty and the defense of the historical picture ordered by the victorious powers, apparently resort to lies without any problems.«
*

We see it the same way: for reasons of state, which is actually not German, but that of the USA, the truth is being kept secret. The Americans still have an extremely great interest in what they do in the AWO area

* The article originally appeared at <https://schwertasblog.wordpress.com/2012/09/20/die-deutsche-bombe>, but is no longer available there. A copy can be found at <https://de.scribd.com/document/133789008/Die-Deutsche-Bombe> (accessed April 19, 2019).

and those around him to keep under the covers, it's extremely embarrassing. Years ago, a representative of the European nobility explained to a German politician in this context: »If we disclose the documents in our possession, no decent German will want to have anything to do with the USA for the next 100 years.« This information , which other people and we received before the Iraq war (2003) from two very different, but usually well-informed sources, sounds a bit cryptic at first, but we think we know what it's all about: the Americans should namely - according to certain Testimonies that we and others received - within a mountain while clearing tunnels in which numerous crates had been stored by German special commands before the end of the war, more or less by chance found access to large underground production facilities, which also had an ongoing (!) included nuclear reactor.

In addition, there are said to be several thousand Germans trapped prisoners who were already in a pitiful condition, but who, according to the witnesses, were not let out of the mountain by the Americans. The reactor was blown up, the access to the tunnel, as the miners call it, shot shut...

If this unbelievable-sounding assertion is correct - we can only get involved for understandable reasons express speculatively that would be a logically understandable reason for the highest secrecy measures.

But back to the mini nuclear test at the Ohrdruf military training area: We have the documentation that reports on the results of the soil sample analyzes (and does not come from the PTB) and to which the author of the above-mentioned article refers. Among other things

The PTB, purely by chance, forgot to mention that cobalt 60 and slightly enriched uranium (just over 10 percent) were also found in the soil samples, not to mention other things. How something like this can happen seems inexplicable, unless one assumes that the so-called "experts" do not know their craft or that massive political pressure has been exerted. The latter wouldn't surprise us at all, because even when taking the soil sample, which was done in the presence of Heiko

* If one discusses the "nuclear event near Ohrdruf" nowadays, the PTB results are regularly mentioned, but almost never those of the "competitor group", although these are mentioned, for example, in an article in the *Frankfurter Allgemeine Zeitung* with the (nonsensical) title "tinkering with Hitler's bomb" (available on the Internet at https://www.faz.net/aktuell/gesellschaft/nachrichten/drittes-reich-basteln-an-hitlers-bombe-i2i2iio.html?printPagedArticle=true#pageIndex_o [as of : March 14, 2005]) were mentioned: »[...] All the same, uranium, plutonium and also the fission product cesium-137 were also found there [near Ohrdruf].

> We can rule out that it was fallout from the Chernobyl reactor accident, says Dirk Schalch from the University of Gießen, who was involved in the measurements. >The Federal Office for Radiation Protection has made inquiries about the distribution of Chernobyl cesium, and in some places we are just above it - and by a lot

But the researchers also found something else: cobalt-60, which is formed when neutrons from fission reactions on iron or steel affect it. Together with the cesium values, this allows only one conclusion for the nuclear chemist Reinhard Brandt from the University of Marburg: It cannot simply have been a "dirty bomb", i.e. an explosive device which, in addition to splinters, also carried radioactive material the area spins.

"During the explosion, nuclear reactions also clearly took place with the release of energy," Brandt is quoted by Karlsch as saying - an assessment that the Marburg scientist confirms when asked was and how this was interpreted.

Petermann and Thomas Mehner (there are film recordings of this), representatives of the MAD (these were the gentlemen who only said 'Hello' and 'Goodbye') took a close look at what was going on.

What were you afraid of? That we find a small atomic bomb from the German Reich?

It goes without saying that something like this was not to be expected. The fact that the crater from which we took the soil samples was probably the result of the March 1945 test was also substantiated by found secret service documents. As is well known, the Berlin historian dr Rainer Karlsch found important Russian documents during his research on the state of German nuclear research, which were reported as follows in the above-mentioned article:

»The German activities had not gone unnoticed by the Soviets either. As early as March 23, 1945, Lieutenant General Ivan I. Ilyichov, commander of the Soviet military intelligence service GRU, sent a top-secret report to Stalin, Molotov and the head of Soviet nuclear research, Igor Kurt Shatov, which said: 'Recently have the Germans in Thuringia carried out two large explosions. They took place in a wooded area in the strictest secrecy. Trees were felled to a distance of five to six hundred meters from the center of the explosion. Fortifications and buildings erected for the experiments were destroyed. Prisoners of war who were in the center of the explosion perished, often leaving no trace of them. Other prisoners of war at some distance from the center

Those caught in the blast sustained burns to their faces and bodies, the degree of which depended on their distance from the center. [...] The bomb probably contains U-235 and weighs two tons. [...] The bomb explosion was accompanied by a powerful detonation wave and the development of high temperatures. In addition, a strong radioactive effect was observed. The bomb represents a sphere 130 centimeters in diameter."

At this point we do not want to repeat everything that Dr. Rainer Karlsch, Heiko Petermann and other people was published or discussed, but will have to go into it again when the opportunity arises. In this context, however, we are surprised that contemporary witnesses and Russian espionage reports focused the "event near Ohrdruf" on a very specific location, where there is even a crater (about 50 meters in diameter), but then in nothing suspicious should have been found in the soil samples - at least according to the opinion of the Physikalisch-Technische Bundesanstalt, which we personally do not trust.

That in relation to nuclear events in this country massive being manipulated could already be observed before, for example in the north of the republic, not far from Hamburg, on the sites of the Krümmel nuclear power plant (which has since been shut down) and the GKSS company (today with a different name), as well as in the entire surrounding area (Elbmarsch etc. pp.) after an "accident" that occurred on September 12, 1986 and for which there were numerous witnesses, microbeads (so-called PAC beads) could be found years later. A local citizens' group that formed when it became a si

significant increase in leukemia cases in (infant) children, and commissioned the physics experts to analyze these beads, was confronted with the most outlandish official explanations, one of which was, for example, that what was found was worm excrement.

However, when the physicists were then able to determine the exact composition of the globules (plutonium, americium, curium), the responsible public prosecutor's office had the soil

** To this day, the responsible authorities refuse to admit the accident, although the beads can still be found.

**

The process is shown at [http://www. Strahlentelex.de/ Stx_01_350_S03.pdf](http://www.Strahlentelex.de/Stx_01_350_S03.pdf). Here it says, among other things: »Six officers each from the State Criminal Police Office in Kiel, the local police and the responsible supervisory authorities confiscated from engineer Heinz Werner Gabriel in Weinheim (project manager of ARGE PhAM) and from Dirk Schalch, physicist and head of the radiation protection department at the Justus Liebig University in Gießen, samples from the Elbgeest and Marsh, in which particles with artificial radioactivity had been detected.« Those affected must have been surprised that the state took action against them. Some test results and finds are obviously so explosive that those responsible in Germany do not even shy away from bothering scientists, although freedom of research, teaching, science and art is supposed to be guaranteed in the Basic Law (Article 5, Paragraph 3). We write "should be" because the corresponding passage reads: "Art and science, research and teaching are free. The freedom of teaching does not absolve one from loyalty to the constitution.« Scientists obviously violate the constitution (the basic law) when they examine samples and determine a composition that, in the opinion of the local government and authorities, should not exist.

Do you still remember the book *Jonastal Conspiracy* that was published years ago by our colleague Gerulf von Schwarzenbeck? In it he published, among other things, very interesting testimonies - some of which we contributed - and also an interview we conducted on the subject of fusion weapon technology, which relates to the findings of Friedwardt Winterberg, a student of Kurt Diebner - the one who carried out the test at Ohrdruf To the astonishment of the author, the book was distributed worldwide - above all it reached those who were originally born in Germany but later found a new place of residence and sphere of activity.

-, supported.

As a result, von Schwarzenbeck received numerous interesting letters and e-mails from one of Reinhard Gehlen's nephews.

Reinhard Gehlen? There was something ...

Correct. The *Frankfurter Rundschau* wrote about the German secret service agent:

»Gehlen, born in Erfurt in 1902, rose to the rank of general at the beginning of National Socialism. He later became head of the Foreign Armies East department, whose task was to evaluate and draw conclusions from prisoner interrogation records, reports from the troops and information from the foreign intelligence service during the Second World War.

The realization that this information was no longer sufficient in view of the increasingly difficult situation of the German army and the successes of the Soviet army led Gehlen to develop his own organization for reconnaissance and espionage from his department. In 1945 he changed back then

43-year-old the pages and served the Americans. The so-called Organization Gehlen became the BND in 1956. «*

The Internet *encyclopedia Wikipedia* provides additional information on this:

“The head of the Gehlen organization and later the first President of the Federal Intelligence Service, Major General a. D. Reinhard Gehlen, surrendered to the armed forces of the United States shortly after the end of the Second World War and entered their service. A few months later he built up the organization on behalf of and with the support of the American occupation authorities and helped many former employees of the Foreign Armies East Department of the former German General Staff, which he had previously headed, who were responsible for assessing the enemy situation on the Eastern Front through procurement and evaluation of news, to a new career in the young Federal Republic.

Gehlen's department for foreign armies in the East had a reputation for systematic and precisely documented detailed work and differed - according to Walter Schellenberg - in this way from other German intelligence services f
**
Time of the nationalsocialism."

General Reinhard Gehlen therefore seemed to be a man who knew his trade and who, despite National Socialist recent past and career then easily in

* <https://www.fr.de/politik/nazi-general-bnd-chef-11002428.html> **
https://de.wikipedia.org/wiki/Organisation__Gehlen

able to change the service of the Americans and the Federal Republican system. A process that allows a deep insight, but will not be dealt with further here, especially since whole books have been written about the man. A look at the relevant antiquarian bookshop catalogs and websites shows this more than clearly.

Reinhard Gehlen in 1943

(Bundesarchiv, Bild 183-27237-0001/Wikimedia Commons, CC-BY-SA3.0)

It goes without saying that such a person with their outstanding level of knowledge was also informed about things and processes that hardly anyone else knew. Unsurprisingly, Gehlen was also involved in testing a small nuclear weapon

informed at the military training area in Ohrdruf. Gerulf von Schwarzenbeck learned this from his nephew years ago General Gehlens, Wilhelm Reinhard Gehlen, who in an email dated March 23, 2009 stated the following:

»I am a World War Two veteran (Hitler Youth, 64th flak fire, Ruhr area 1944 -1945). I live in the USA and translate letters, documents and books from German into readable English for people interested in history.

I recently bought a box of Feldpostbriefe, which I am currently translating, when I came across a rather private letter from a soldier serving in Ohrdruf. My curiosity arose from the fact that my father also served in Ohrdruf for a time. Further research brought me to the book by Mr. von Schwarzenbeck, which I was able to purchase in Germany. There are many letters I still have to work through; some come from a man whose family lived in Berlin-Reinikendorf and whose wife worked at Siemens. The letters

seemed quite strange to me, but when I read the book I was able to put two and two together, helped by the stories my father told me after the war. My uncle was also briefed on the "Ohrdruf story," but I gave little thought to it at the time. My uncle was Reinhard Gehlen. [...]"

In another email dated May 20, 2009, the answer to the reaction of Gerulf von Schwarzenbeck was, who had also asked some questions, informed the General Gehlen's nephew on more details, among others

also in relation to his father, i.e. the brother of the secret service general:

»[...] First of all: Yes, my father was in Ohrdruf until the end of March 1945 and then fled to Denmark.

He was in an assault gun battalion in Russia (middle sector) and had been wounded - somewhere in a nest near Kalinin.

He was taken to the hospital in Heiligenstadt (Eichsfeld) to be cured, ~~where he was released in mid-1944, but~~

was assigned to the supervisory department in Ohrdruf. He was at home after his release from captivity in July 1945.

Only after the war, I think it was the June fair in 1946, did he tell us about the Ohrdruf bomb or grenade, and it happened like this: At the fair there was an exhibition booth with color pictures of catastrophes. For 50 pfennigs one could look at the atrocity pictures exhibited in the booth. Among other things, they showed a picture of the atomic bomb explosion over Hiroshima, and my father said: 'That's nothing new, we had that thing too Around 1945 such a thing exploded at a remote location near Ohrdruf, killing many forced laborers. The site was not allowed to be inspected by security guards because it was too dangerous.

* According to *Wikipedia*, there were eight military hospitals in Heiligenstadt at the end of the war with 3,000 wounded (https://de.wikipedia.org/wiki/Heilbad_Heiligenstadt [accessed February 2, 2019]).

Since our family lived in the West, we were unable to get there once, and it wasn't talked about anymore.

Well, I live near Oak Ridge, Tennessee, and I often visit the Atomic Museum there. Likewise the NASA complex in Huntsville, Alabama; I am also informed that it is always claimed that the atomic bomb was built by the USA. A few years ago, while revisiting Oak Ridge, I struck up a conversation with a scientist as we stood in front of a faithful model of the Hiroshima bomb. I mentioned that I am German and he casually remarked: 'Yes, you Germans helped us to get the thing ready.' I asked: 'Why is that?' and he replied that the detonation [of the bomb] was a German solution was.

All of these stories are almost forgotten over the years, but reading the book about the Jonas Valley brings some things back to mind - and everything fits together. I also have some photos that show a group of men in white coats (scientists???) and that come from Ohrdruf. And also some letters from the field post, which I will read through again. [...]"

In a third email dated May 25, 2009, Gerulf von Schwarzenbeck also learned:

»My father was already 44 years old at the time (born 1901) and before he was injured he was in a self-propelled gun regiment in the Russian central sector. He probably owes the fact that he came to Ohrdruf to his wound, and the hospital was also in Heiligenstadt

not far away. It's just a pity that in the years before 1960 nobody was interested in these things.

I am now trying to find some former gis who were involved in the occupation of Ohrdruf.

Unfortunately, although it has only been six years since I met the gentleman at Oak Ridge, I cannot remember his name. He

was already retired, as he said. I'll be going to Oak Ridge again in the next few weeks, it's not far from me. Of course, most of the people involved in the atomic bomb reject German cooperation - if only for reasons of prestige (typical USA: we know everything better).

My uncle [Reinhard Gehlen] only mentioned a superweapon once and that was around 1970 when I last met him. He said at the time that by the end of 1945 the war could have been won if Germany had had a little more time. At the time he spoke of a fusion grenade that had been constructed. Of course I knew what a fusion was, but at the time I had no idea what it had to do with an atomic bomb. [...]"

Von Schwarzenbeck showed us this e-mail correspondence at the time, which for us was another important piece of the jigsaw puzzle of contemporary oral history, but could not bring himself to publish it or have it published by us. Well, times are changing.

After the third, last email, von Schwarzenbeck tried several times to reach Wilhelm Reinhard Gehlen, but was unsuccessful. We did the same - with the same result. Only recently did we become aware of

that the Gehlen nephew operated/operates a website through which we tried to contact him again, which has not been successful to date. We suspect, to put it mildly, that this has biological reasons.

Three clues in the e-mails strike us as noteworthy: a) that the well-known intelligence general Reinhard Gehlen was aware of the test at the Ohrdruf military training area, b) that he had a brother who personally witnessed the test, and c) that the general was of the opinion that the war could have been won with this weapon system if Germany had only had a little more time...

Somehow, these remarkable disclosures fit into the picture we created nearly 20 years ago: that, as US Chief of Staff George C.

Marshall emphasized immediately after the Second World War that the Normandy invasion was necessary because the intention was to prevent the use of nuclear-based weapon systems being developed in Germany against the USA and its allies at all costs.

You had to attack whether you wanted to or not.

And that the Germans on numerous scientific and technical areas were in charge, gave after the War was openly endorsed by highly decorated Allied officials, such as US Major General Hugh Knerr, who opined:

»The occupation of German science and industry has shown that we are alarmingly backward in many areas of research. If we don't seize this opportunity to use the devices and minds they have developed, we will be lagging behind for many years while realizing work already done.«

"He who *indulges crime becomes*
his accomplice."

Voltaire

Update 2: The Auschwitz Experiment - **DID IT TAKE PLACE?**

Readers who have followed our account from the beginning will perhaps remember that in our first book, *The Secret of the German Atom*

bombe (we quote below from the 3rd edition of May 2009) on pages 263 and 264 mentioned a highly astonishing event: the interrogation of the former Reich Minister of Armaments Albert Speer by the US judge Robert H. Jackson at the Nuremberg trial against the main war criminals, which took place from November 14, 1945 to October 1, 1946, the latter confronting Speer with a gruesome incident of a special kind - the complete annihilation of 20,000 people, all of whom were said to have been Jews, at Auschwitz. We wrote the following about it at the time:

»During the Nuremberg war crimes trials on June 21, 1946, the former German armaments minister, Albert Speer, was questioned about nuclear research and secret weapons. The answers he gave demonstrate a - in our opinion feigned - ignorance about these things. Judge Jackson, who asked the questions, seemed satisfied with the answers given, which surprises us personally, since Speer had given much more detailed information to the CIC interrogators immediately after the end of the war.

>Justice Jackson: I have been given a certain report of an experiment that was being conducted near Auschwitz and I want to know if you heard about it or knew anything about it. The purpose of this experiment was to discover a quick and effective means of exterminating people without having to go to the lengths of shooting, gassing, or burning that had been done hitherto. As I was informed, the experiment was carried out in the following form: 20,000 Jews were housed in a small makeshift village that had been set up temporarily for this purpose. Using this newly invented

These 20,000 people were almost instantaneously annihilated, and so much so that nothing was left of them. The explosion generated a temperature of 400 to 500 degrees Celsius [obviously a mistake, for logical reasons one must assume 4000 to 5000 degrees Celsius, authors note] and so destroyed the people that they left no trace at all.

Speer: No, I also think that is absolutely improbable. If we had had such a weapon in preparation, I would not have been unaware of it. But we didn't have such a weapon, because it is clear that in the field of chemical warfare both sides tried to research all the weapons that were even possible, because they didn't know which part to use chemical war begins. < Well bluffed - we would say. The whole thing had nothing at all to do with chemical warfare agents,

but can at most have been an atomic test, if nothing is said to have remained of 20,000 people.«

*
We had come to talk about this questioning of Albert Speer at the time, because in a letter that a certain Adolf Bernd Freier had written the test of a nuclear weapon at Auschwitz was very briefly mentioned:

"Another detonation took place near Auschwitz, where there were numerous deaths and the IG Farben concern^{**} was delighted with the success."

At this point we do not want to go into the question of whether the person of Mr. Freier actually existed (the critics believe that he never existed and that his representations are forged; we naturally see it quite differently), but here only state that a lot of personal information that had nothing to do with the Auschwitz experiment made further targeted research possible - which was what ultimately mattered to us.

Another circumstance was strange at the time: that the American researcher Carter Plymton Hydrick in his book entitled *Critical Mass. How Nazi Germany Surrendered Enriched Uranium for the United States' Atomic*

* Source of Speer testimonies: *Nuremberg International Military Tribunal: The Nuremberg Trial of the Major War Criminals from November 14, 1945 to October 1, 1946*, published in Nuremberg 1948, approved special edition, Volumes 15 and 16 (in one volume), Komet MA- Service und Verlagsgesellschaft mbH, Frechen o. J., page 580.

** Edgar Mayer/Thomas Mehner: *The secret of the German atomic bomb. Did Hitler's scientists win the nuclear race after all? The secret projects near Innsbruck, in the Jonastal area near Arnstadt and in Prague*, Kopp Verlag, Rottenburg, 4th edition March 2011, page 250.

*Bomb**, which at the time was only available as a manuscript, went into detail about the Auschwitz site, and here in particular about Auschwitz III, Monowitz, and took the view that synthetic rubber, Buna, should not be manufactured there, as was publicly announced, but in reality material capable of being used for nuclear weapons was enriched, which later found its way into the US Manhattan Project. He came to this conclusion without knowing about our research and consequently knew nothing about the free letter, which after all brought IG Farben into the focus of the considerations.

IG Farben plants in Auschwitz

(Bundesarchiv, Bild 146-2007-0057/Wikimedia Commons, CC-BY-SA3.0)

* *Hydriek* 's work is currently available in paperback (Trine Day, 3rd edition, August 2016, <https://www.kobo.com/us/en/ebook/critical-mass-23> [accessed 27 April 2019]). For more information, see: <https://www.kirkusreviews.com/book-reviews/carter-hydriek/critical-massw/> (accessed 27 April 2019).

Incidentally, quite independently of this indication, we came to the realization relatively early on that German large-scale industry - and here in particular one group

like IG Farben - must have played a leading role in the development of a nuclear weapon. Basic research was one thing; but when it came to serially producing a weapon, it certainly had to be done by one of the leading German companies at the time that had the relevant experience and capabilities. (If this was IG Farben, then it also explains why nothing was announced about it after 1945, because there were certain relations between IG Farben in the USA and IG Farben in Germany during the war

Rich when it came to business matters.

The fact that there must be a connection between German nuclear research and IG Farben becomes obvious when you look at a passage in the Farm Hall minutes that apparently escaped the British censorship.

(Some of the German nuclear scientists were interned in the British Farm Hall after the war, and their conversations were bugged and recorded by the British secret service.)

A strong indication that IG was in control of Farben Processes mastered, for example, with processing

* The extent of these business relationships and the extent to which they had ideological backgrounds has been discussed for decades. Apparently, the "pressure in the boiler" must have been quite great when even the scientific services of the Bundestag presented a paper on the subject entitled "On the Discussion of Alleged Cooperation between US Companies and the Nazi Regime". (WD1 -134/07,2007, available on the Internet at <https://www.bundestag.de/resource/blob/413382/5fifiif4a4d63a299463e4ao28683e55/wd-i-i34-07-pdf-data.pdf> [accessed on 27. April 2019]).

of uranium, became apparent in a discussion between the interned Germans when the question came up as to which process was used to enrich the basic materials for the American atomic bomb and how many personnel had to be deployed for this. We had already pointed out the treacherous passage in our first book, *The Secret of the German Atomic Bomb*, but we want to repeat it here again after all these years, because we know that a) this information was ignored, and because we b) believe that the following makes it clear that we know far too little in relation to certain historical events and that the IG Farben/German atomic bomb connection should be expedient. In addition, we want after that

present a report that sheds some light on the events surrounding the experiment in Auschwitz. Due to the fact that it contains some information that seems almost unbelievable, we want to show something flanking, verifiable:

»Heisenberg: On the other hand, the whole heavy water thing, which I supported as much as I could, can't generate explosives.

Harteck: Only when the machine is running. [...]

Harteck: If it's true that an explosive can be produced using the mass spectrograph, we would never have done it because we could never have employed 56,000 workers. For example, when we were considering the Clusius-Linde thing in connection with our replacement cycle, we would have had to employ 50 workers continuously to produce 2 tons a year. If we had wanted to make 10 tons, we would have had to employ 250 men. We couldn't do that.

Weizsäcker: How many people worked on the V1 and the V-2?

Diebner: Thousands worked on it. [...]

Heisenberg: I have to say that I believe your theory is correct and that it was spectrographs.

Wirtz: I'd bet there weren't any.

Heisenberg: Why else would you need 60,000 people?

Korsching: Try vaporizing 1 ton of uranium.

Harteck: You only need ten people for this. I was amazed by what I saw at IG Farben.» (Emphasis added)

What technical solution did Paul Harteck see at IG Farben?

Unfortunately, we don't learn anything more about this, but obviously a method must have been used that was very effective and, above all, required little staff.

The whole thing also indicates that those German nuclear scientists who sat in Farm Hall were not necessarily the ones who really knew (unless some suspected the wiretapping operation and therefore pretended), but that there were others who may still have known to this day did not appear by name. That would also speak for the thesis we have been advocating for years, that behind the official program there was at least one other program that was much more successful.

* Dieter Hoffmann: *Operation Epsilon. The Farm Hall Protocols or The Allies' Fear of the German Atomic Bomb*, Rowohlt Verlag, Berlin 1993, page 154.

But now let us turn to the "incredible" account. In 2005, as luck would have it, we received further information on the so-called Auschwitz experiment, which the author had already given us permission to publish in writing at the time, but which we did not publish due to its unusual nature, but initially sent it to a friend, a Polish researcher, in the hope that he would be able to find the location of the "experiment".

Oddly enough, we never heard from him again after that, which is perhaps why we didn't publish it.

When the report came back to us about a year ago
fell hands, we agreed that a) we should now publish it with the necessary restraint and b) to comply with the request of the gentleman who handed it over to us and to anonymize some names - including his own - because we were expressly asked to do so at the time. The report contains, as much as we want to let you know in advance, three names of physicists who played a leading role in the development of the German atomic bomb, but who did not appear anywhere in this context after the war. Two remained completely unknown, while the third, a native of Austria, continued his work as a (supposedly only theoretical) physicist and was apparently never questioned about what happened at Auschwitz. His biography, which can also be found on the Internet, reveals a strange gap: in the period from 1933 to 1945, from a professional point of view, the man was apparently put into a kind of deep sleep, because nothing is reported about his activities or research during this time. Although we have to add that this oddity has already been observed by many other German and Austrian scientists

could become. It is clear that they had not emigrated or been drafted into military service, but continued to work in the scientific community.

Here is the report given to us:

»On Friday, June 21, 1946, the chief prosecutor for the United States of America in the Nuremberg war crimes trial cross-examined the Minister of the Reich Ministry for Armaments and Production in the former Third Reich.

That chief prosecutor was Justice Robert H. Jackson, and he was known for being an excellent lawyer but not an expert on the structure and circumstances of the Third Reich. The entire hierarchy was evidently a mystery to Mr. Jackson, since he couldn't really classify the two Krupps, Gustav and Alfried, for example. One of them, namely Gustav, who was already half dead and hadn't been the owner of the company since 1943, was put on the indictment list by Jackson, which actually included Alfried, who had to be acquitted in the end.

Jackson does not appear to have been well liked by his staff. In the memoirs of Prosecutor Telford Taylor, he gets a bad mark for his behavior.

Trial observer Janet Flannel writes in ei
in a 1979 New York book about Jackson:

>Not only did he seem to lack the background and shrewdness of our Richter Holmes tradition, but his learned European foreground was full of holes he fell into when he set out
Goering to set traps

Justice Robert H Jackson (circa 1945).

(Source: Harris & Ewing Collection in the Library of Congress, Washington, USA; Wikimedia Commons, Public Domain).

Goering, now weaned off drugs, had overcome his inertia and was in the best intellectual form during interrogation, capable of defeating the lead prosecutor, Jackson.

In any case, Jackson's reputation was badly damaged when he set out to cross-examine Speer.

In the morning session of June 21, 1946, Jackson first asked questions about Speer's personal development

in the Third Reich, then on the problems of prisoners of war and forced laborers and then on the development of warfare agents and their use as well as corresponding experiments.

Jackson: 'Who led the experiments?' Speer:

'That was the development department in the Army High Command in the Army Weapons Office

knowledge. I can not say it exactly. ' Speer showed himself extraordinarily ignorant.

He said there were three factories that produced these substances, such as tabun and sarin.

He shut them down in November 1944 by stopping the delivery of the preliminary products.

It will have to be proven later that Speer lied massively here. [This argument is not included in this report, authors' note.] Production went on uninterruptedly, and not just in the three factories. The supplies created still exist today.

In this context, however, something else is of interest. Jackson keeps asking questions, and in doing so, the climax of Speer's interrogation takes place in a few minutes, unbeknownst to the public, then and now.

Jackson asks: 'And certain experiments and research were also carried out in atomic energy, weren't they?' When we emigrated to America, we were set back very badly in nuclear research, and we were actually a year or two away from

to maybe get an atomic smash. <

Here I have to raise two objections. Firstly, the best people we had in atomic research, apart from Einstein, remained in Germany, and secondly, according to the usual interpretation, atomic fission was already accomplished in Germany in 1938.

I even claim that this event took place in May 1934, but that at that time ^{*}in the KWA Berlin the participants in the experiment in question, but especially Hahn, Meitner and Straßmann, who had achieved this breakthrough, in the sharpest form of one Colonel [...] ([...] in the Army Weapons Office) was condemned to be silent and to be silent again. [...] even went so far as to have an oath taken.

And although Jackson must have known that atomic fission, according to the usual interpretation that was imposed on us, first occurred in Germany in 1938

* Ever since contemporary historiography on the subject of the »atomic age« began, the interested readership has been told that nuclear fission was »invented« in 1938. But is that true? And what if this basic information, which is one of the mainstays of the related contemporary histories, was wrong?

In recent years, people who have been in contact with those involved in the German nuclear program have often claimed that the first successful nuclear fission was realized as early as 1934.

However, nobody wanted to believe this information.

It is just strange that in the archives of the American NARA there is a document ("Memorandum for the Commanding Officer, Garmisch Sub Region") dated September 27, 1946, in which two CIC special agents, Paul O. Bruenl and Robert W. Stout, reported on the results of an interview with the German informant Willi Waldow (born 1920 in Stettin), who met a German engineer (W. Brueckner) who, by his own admission, had been active in nuclear research since 1934 and also reported that that 2000 to 3000 Germans with scientific and [—> continue on page 91]

took place and he could easily have contradicted Speer, he responds to Speer's answer with the following stupid and irrelevant question: 'The policy of expelling people who disagreed with Germany hasn't yielded a good dividend, has it? < Speer then: >That had a very decisive disadvantage for us in this area. When you read this, it almost seems as if the two of them were of the same heart.

But it gets worse.

Jackson begins a lengthy explanation: He asks: 'I have been given a certain report of an experiment that was carried out near Auschwitz and I want to know if you heard about it or knew about it. The purpose of this experiment was to discover a quick and effective means of killing people without proceeding - as had been done hitherto - to shooting,

technical background on the use of nuclear energy and the development of an atomic bomb.

Although the two CIC agents were not able to examine the statements of their informant more closely, it is highly remarkable that one can find information in US document stocks that does not fit the picture of the establishment historians, but instead correspond to what proponents of the view that the German Reich was working on nuclear weapons have long claimed. Why should an engineer have dealt with questions of nuclear technology as early as 1934 if nuclear fission was not realized until 1938?

Source of the mentioned document: NARA, National Archives and Record Administration: RG 319 (RECORDS of the ARMY STAFF). Records of the Office of the Assistant Chief of Staff, G-2, Intelligence. SECURITY CLASSIFIED INTELLIGENCE AND INVESTIGATIVE DOSSIERS, 1939-1976. Impersonal File, Entry 134A, Box 17. Folder: XE 169886 Russian Deportation of German Scientists & Technicians.

gassing or incinerating, could destroy as quickly as possible. As I was informed, the experiment was carried out in the following form: 20,000 Jews were housed in a small makeshift village that had been set up temporarily for this purpose. Using this newly invented

These 20,000 people were almost instantaneously annihilated, and so much so that nothing was left of them. The explosion generated a temperature of 400 to 500 degrees Celsius and devastated people so much that they left no trace at all. < [We had already pointed out that the temperature specification must be 4000 to 5000 degrees Celsius. Authors' note] With that final, incredible sentence, Jackson ended his remarks. Did he now expect that the man before him, whose job it had been to clear every newly developed weapon in the Third Reich for both experimentation and use, would ruefully confirm the event at Auschwitz?

The question arises as to what purpose the Prosecutor's statements were intended to serve.

Jackson speaks of 'being' handed a certain report to him. But who gave him this report? Was it American or British intelligence? Was it Polish informants, of whom there were many, who worked with Allied intelligence?

Were they prisoners from Auschwitz? Jackson doesn't say it. He only speaks very precisely of certain circumstances and facts. First of all that it

was an experiment aimed at exterminating people as quickly as possible, secondly, that it was a small makeshift village that had been set up temporarily, thirdly, that 20,000 Jews were housed there.

Here there is a first contradiction. 20,000 Jews could not have been accommodated in a small, provisional village, it would have had to have been a larger village or a small town.

Fourth, he [Jackson] speaks of a newly invented destructive agent that detonated humans by means of an explosion, literally: 'that they left no trace at all'.

Here, too, one has to object that a complete disappearance is not possible. If such an event did take place, and it undoubtedly did, for Jackson or others certainly did not just fabricate this account to snub the responsible Nazis in the dock, so if it did take place then it would have both complete corpses as well as body parts.

But when he, Jackson, previously spoke of experiments with atomic energy and immediately afterwards mentioned an explosion that destroyed everything in an instant, then he can only have meant an explosion of an atomic bomb.

If one now assumes that Jackson submitted the report to the court as an official document in order to ensure that the matter would be investigated further, one would of course be gravely mistaken. Neither the court nor the prosecutor Jackson ever mention this sensational report. You, the Allies, even think

refusing to use the report, which must have a real basis, against the accused as part of the charge of 'crimes against humanity'.

Could this have something to do with the atomic bombs being dropped on Japan almost a year earlier?

The Nuremberg court often showed strange behavior, for example towards certain people. General Rammler by the way

spiel is mentioned only once during the trial, a few minutes before Albert Speer's quoted report by Prosecutor Jackson. He speaks of a Obergruppenfuhrer Rammler - as if he were almost unfamiliar with the one responsible for firing

-, of rockets to England was responsible. The name is not mentioned before or after by members of the court or by the prosecution, as if one shuns it like the devil shuns ^{*} holy water.

As I said: Speer speaks of Rammler as if he had only heard of him in passing.

To tell the truth: Rammler's people had set up the 'temporary village', and under Rammler's responsibility the Jews concerned had also been settled there or forced to set up the 'temporary village'.

* It is difficult to judge whether this representation is correct. It certainly applies to the main process. However, there were still a few follow-up lawsuits, including one (number 4) against the Economic Administration Main Office (WVHA) and those responsible, which would have to be examined in this regard. Years ago we received the almost unbelievable information that Hans Rammler was present during this trial, but not as a defendant.

And to continue to tell the truth: on October 27, 1944, at 7 p.m. when the explosion near Auschwitz occurred, Speer was standing a few meters from Rammler in a bunker that was about 12 kilometers away from the site of the explosion.

Only three people stood between Rammler and Speer. These were Dr. [...], responsible for secret nuclear research [...], a professor [...], born in Austria, since May 1940 [...] involved in the development and construction of the atomic bomb in the Room Ohrdruf in Thuringia, and a Dr. [...] who [...] dealt with the construction of the big bomb - there were three versions. In any case, he was the commander of the corresponding development team, to put it in modern German.

I have now named five people, along with Rammler and Speer, who framed the above. However, there were 20 more in the said bunker, whose names will be mentioned later, and among them no fewer than three other ministers of the Reich, including Speer, four.

These 25 men stood in the half-darkness of the bunker as if in silent expectation and stared through the hatches towards the south because of the coming glaring, bright light, wrapped in shapeless and clumsy clothing and equipped with dark glasses, as if they had come straight from another planet and would now bring the world a happy age or the absolute catastrophe.

* The other names are not mentioned in this report.

** We subsequently received three names of the ministers involved, one of whom was Joseph Goebbels. More on that later.

And without a doubt, these men were all of different kinds, some doubted that their plan would succeed, some were in high spirits and confident of victory and others depressed and guilty, which turned out to be a violent, implacable one on the plane back to Thuringia the next day at the latest A dispute arose, which had consequences.

But I allowed myself to get carried away, even though we are still in the devastated Nuremberg of 1946 and although it would be senseless and useless to describe an event that nobody would understand, since we do not know the history.

So first of all, back to Nuremberg.

Prosecutor Jackson had made his statement and asked his question. He, Jackson, a pudgy, excited and supposedly ignorant man from the USA, looked intently at Speer, a handsome, humble and cooperative middle-aged man from Germany, and waited hopefully for an agreeable answer.

Albert Speer, after a certain inner twitch, which was in no way reflected in his facial expression, replied in a very controlled and almost astonished manner: 'No, I also think that's absolutely improbable. If we had had such a weapon in preparation, I would not have been ignorant of it. But we didn't have such a weapon, because it is clear that in the field of chemical warfare both sides tried to research all the weapons that could be used

were only possible because you didn't know which part started with the chemical war. < Of course, Speer deliberately distracted with this answer by talking about chemical warfare agents, which was no longer the point. Jackson had gone so far as to speak of a massive explosion.

But what did such a thing have to do with chemical weapons?

Had Speer answered truthfully, he would have slipped the following: 'Yes, I took part in this experiment myself, even sanctioned it myself, and it involved two medium-sized atomic bombs detonating within a second or two of each other were brought. The result would have been: he would have been hanged like the others, and not because of the pitiful men, women and children, in whose fate the Allies were in no way interested, otherwise they would present the report as an important document and the crime pursued, but because of the naming and description of an event that the existence of atomic bombs in the Third Reich all over the world

would have shown.

Above all, Speer would never have had a chance to speak again during the trial, but would have died on the spot through "suicide."

But he didn't want to die, and above all he didn't want to be hanged, for he had known the exaltation of power and a life that had taken him to dizzying heights.

So he answered the questions in the way that was expected of him and cooperated as before when he shared his knowledge of the

made certain services available unreservedly to the
*
Third Reich.

Jackson could be satisfied and now, with the next question, he was already drawing the conclusion from everything that had been fooled around the world so far by the tribunal.

* Albert Speer was a person who reported untruths when it was useful to her. At the end of the war he had betrayed the use of the miracle weapon in Thuringia and for this - in our opinion - the Allies had let him live. (We reported on this in a book that was published years ago.) The fact that Speer was not who he once claimed to be after the war has become increasingly apparent, especially over the past 10 to 15 years. See in general: https://www.deutschlandfunk.de/ns-geschichte-die-legende-vom-unwissenden-zeitzeugen-albert.13io.de.html?dram:article_id=393085 and <https://www.mz.de/wissen/wissenschaft-regional-albert-speer-legenden-and-lies-about-a-supposedly-good-nazi-290729.html>. The content of both Internet links should be viewed with the necessary distance and caution, for example the second one says right at the beginning: "The judges in Nuremberg could have known - they let themselves be taken in by a feigned agreement with the controversial tribunal . A generation of post-war historians might have known - if they had looked at the sources. The whole world, which was thoroughly interested in this personality, was fooled by Albert Speer, as if the "good Nazi" he was playing could have existed. He didn't know anything about the crimes of the Nazis.' The assertion that 'the judges in Nuremberg could have known' is downright naïve, because they knew it. Their whole strategy with Speer was part of a deal to pardon someone who had spared them the use of second generation wonder weapons and their consequences.

In addition, Speer had willingly revealed what the Allies wanted to know from him. He bought his life with certain information, much of which is likely to have remained under wraps to this day.

We are not surprised that the historians failed because they believed Speer and his statements. The whole thing is just embarrassing proof of the fact that this profession a) only rarely has criminal skills, although it actually ought to, and b) often does not conduct any in-depth research, although this is precisely what would be necessary if one were to claims to "work scientifically". For us, the so-called [—> continue on page 99]

He asked: 'So the reports about new secret weapons were exaggerated and only served the purpose of encouraging the German people to keep going to war? Needless to say, Speer happily answered this question in the affirmative and blamed the rumors about new secret weapons on a Standartenfuhrer Berg, who with a great deal of imagination would have spread them to the people in the press.

Jackson had achieved his goal. There were no silver bullets and the chapter could be closed.

Historical "science", as we have often emphasized, is no more than a genre of literature and the talk of "source criticism" is purely a subject-related distraction from one's own inability.

For this reason we choose(d) for our publication(s) in the past, now and in the future the form of a non-fiction book in combination with a personal experience report, since completely objective and 100 percent true representations are impossible in view of what has just been described.

To come back to Albert Speer: who he really was could have been found out in the 1970s if one had wanted to, as he revealed it himself - presented in the book *Albert Speer* written by Adel bert Reif - controversies over a *German phenomenon* (Albert & Graefe Verlag, Munich, 1978, p. 224/225). Speer was a chameleon: a profiteer during the Third Reich and a

Opportunist in the period after the collapse, in which he quickly knew how to adapt to the new circumstances and obviously betrayed everything he knew about the new masters.

Albert Speer wrote a document in November 1945, the importance of which was possibly not fully recognized when it was published in 1978, but which speaks volumes in view of the discussion about the German miracle weapons and in relation to the deal with Justice Jackson. speer wrote:

"About November 17, 1945.

To Interrogation Officer, for transmission to Mr Justice Jackson.

I believe that various military knowledge that I have should not be disclosed to third parties.

(emphasis added by the authors) [—> continued on page 100]

But not for those who submitted the report about the terrible explosion at Auschwitz.

They could still claim what they had seen and experienced, and in a way they were downright in the way. They were in Nuremberg and stubbornly and dogmatically - they were Poles, who apparently didn't care about world politics - they insisted on their claim to proclaim the truth.

[...] From June 1st to the end of October I was in the Dustin camp of the joint American-British office FIAT - There numerous good scientists and technicians went through who were questioned there or before about new developments in armaments. [...]

Since these employees talked to me about their topics, and since I was the only one who stayed in the camp for such a long time, I, against my intention, got a glimpse of where the current areas of interest lie.

During this time, I myself not only gave all the information I could, but also quietly dispelled former employees' concerns about open information. Colonel Lawrence (English), reachable via FIAT., can provide information on this. [...]

In the period from 10.-23. On May 1st, while I was still at liberty (Flensburg Zone), I had detailed discussions with the US Strategic Bombing Survey (USSBS) about the effects of strategic bombing on the German production I was in charge of. - The mistakes made by USSBS were defined and detailed discussions were made about more effective bombing, which could perhaps have significance for the fight against Japan. [-.]

I have given all this knowledge without reservation and, as far as I know, also correctly.

You can rest assured that I have done this work with conviction. [...]

Speer (Albert Speer)

Mr. Hoeffing (FIAT) provides further information about my work."

Albert Speer (left) together with Karl Dönitz and Alfred Jodi after their arrest by the British Army.

(Wikimedia Commons, Public Domain)

They went around town telling, so to speak, to everyone who knew and who didn't want to know what a terrible crime the Nazis had committed and that it was utterly foolish for the court to produce documents of little importance while their own confessions went under the table fell.

In this context, we get on the trail of that ominous report that the prosecutor Jackson had quoted, albeit with some digression must.

At 7 p.m. on October 27, 1944, thousands of prisoners in Auschwitz heard a mighty thunder and rumbling coming from the south. Many claimed it was a double violent explosion and those outside saw

immediately afterwards a tremendous reddish glow, as if flames were shooting up into the sky. Some even believed they saw the glow of the fire first and only then heard the explosions, which was probably closer to the truth.

At that time there was a Pole named G. in Auschwitz. He came from a place near Alienstein [now Olsztyn], now called Czerwonka, was born in 1913 and had the honorable profession of Zimmer

mans. G. was arrested in May 1941 for illegal activities and sent to the Radom concentration camp on the eastern outskirts of the city. He had been brought in, where 6400 of his compatriots were already imprisoned.

He was there from May 27, 1941 to the end of September of the same year, after which he was transported to Auschwitz, where he worked as a carpenter and prisoner on various construction sites. During October 27, 1944, a detail of 330 prisoners was quickly assembled. They were mostly construction workers. G. was among them when the commando left at 5 p.m.

On this march, eyes to the south, at 7 p.m. they saw two bright flashes, heard a double explosion, and almost at the same time saw a tremendous fire raging over a large area at practically the same time. Blinded, they marched in the direction of this fire until, at 8 p.m., they were ordered to set up camp in the open field, that is, they had to sleep on the bare ground while the flames were still beating up to the sky in the distance.

The next day around noon they reached the place where they were to work from now on. It was an exact one

Square about a kilometer on a side, with the tower still burning and smoking

was overcast. They smelled not only the burning wood, but also that sweet odor of burning human flesh that they knew well enough.

They marched to the edge of the area where a small town had stood the day before and where a few hours before them 25 people in protective suits had dared to penetrate just 200 meters into the former town, only to be immediately triumphant and at the same time turn back in horror. Of course, only a few had triumphed and expressed enthusiasm. Others had run silently and hastily, and still others were so terrified and shaken by the atrocities they beheld that they quickly and suddenly turned back and vomited.

The 330 prisoners wore no protective suits and did not see any during the weeks in which they now had to clear away the stone rubble.

On November 3, 680 Poles and Russians joined them, so that by December 15, 1944, more than a thousand prisoners had removed the stones from the radiation-contaminated wasteland and burned the bodies and body parts that were still there. All traces were erased by mid-December. On December 17, the prisoners, apart from those who had since died, were back in Auschwitz, where the rest, save a few, were killed. The few consisted of about eighty prisoners, to which G. belonged.

In the confusion of the past few weeks from Ausch
joke - the Russians liberated the inmates of the camp

on January 27, 1945 - one forgot to kill those for whom death had actually been decided. Some also knew how to hide among the ranks of the survivors of the camp. So G. got away and made the first statement before a Polish commission in Warsaw in February. A total of nine survivors reported. On February 22, G. initially reached

Allenstein and then his native village.

In the spring of 1946 he received another invitation to Warsaw, where seven former prisoners reported on the event. He remained in Warsaw until May 5, after which he met 23 witnesses at a house 15 kilometers west of Warsaw, where it was said they were being taken to Nuremberg to testify before the International Court of Justice.

G's group consisted of four witnesses and three government representatives who were provided with that official report of the event. They traveled to Nuremberg together with the other Polish witnesses who had made themselves available because of certain events during the German occupation.

Luckily, the group of seven Witnesses, including the government representatives, were - or so they thought - accommodated outside of Nuremberg. The destroyed city still smelled, almost a year and a half after the end, of destruction and war. They were happy to be accommodated in a camp in the great outdoors near the city, it was a barracks camp.

680 foreigners crouched there in six large barracks and waited for their return, or not, since they

but didn't know what awaited them in their country.

They got more bad than right from twelve American

nian soldiers supervised.

They, the seven witnesses, were alone in a small six-room barracks at some distance from the others and had it quite luxuriously under the care of the Americans and in view of their rich army rations.

Admittedly, G. and the other witnesses were fatally reminded of Auschwitz by the way they were accommodated, since the barracks immediately came to mind as old acquaintances from the rule of the Third Reich

eye fell and brought back a lot of memories.

Now that the witnesses had made quite a racket with their reports, it became frighteningly quiet around them, and their defiant talk seemed to be lost in nothing, until suddenly, on July 16, 1946, it was late at night 11 p.m., ambushed in their barracks by a gang of ten in plain clothes and shot in the head as if the riflemen were specialists, with silenced pistols within a few minutes.

During this argument, which was really just a slaughter, only Polish words and words in another, very common foreign language are said to have been spoken. The killers disappeared as quickly as they came, and efforts to catch them came to nothing.

What must have remained of all this would be at least the following: 1) newspaper reports from July 1946 in and around Nuremberg, 2) the official Polish report on the said event at Auschwitz, wherever it may be, 3) a site 20 kilometers to the south

of Auschwitz north of the village of Kozy, where two bombs, each with 4.5 kilograms of plutonium, exploded in October 1944.

This would have closed the Nuremberg chapter if some responsible US scientists and military personnel had not had the obvious idea of seeing for themselves on the spot and as soon as possible that the prisoners' report was based on facts was based.

They were also thorough, you have to give them that, although not as brutally thorough as the Germans.

On April 16, 1947, 17 military personnel set out from New York on a journey that took them to Poland.

The delegation - all members of which were members of the US Army and came from a special group - consisted of ten physicists, five chemists and two warfare specialists.

The commander was a general [...] who successfully [...] hunted behind the German atomic bombs.

The General [...] had been ordered on February 13th to set out with others, and he had then studied everything available and carefully assembled the men and arrived with them in Warsaw on May 8th, a memorable day .

Here the second anniversary of the victory was celebrated and immediately a good one was poured on the lamp with the Polish government representatives. The Americans had wisely brought whiskey with them.

On that day they could still laugh, while shortly afterwards in Auschwitz things looked different. Then they walked in silence and shaken by everything that could still be seen.

On May 17, they and eight Polish officials drove 12 miles south and ended up in a desolate, deserted area about a square mile in size that was about as flat and uniform as Manhattan if you strip away the houses. It almost seemed as if the Germans had done the right thinking when choosing this barren landscape.

It was a sad piece of land, so to speak, where you could hardly see anything and which was silent and said nothing at all.

They had seven good Geiger counters with them. They were the only objects that spoke, and they did so violently. It was later claimed that the radiation was 600 times stronger than normal.

They all stupidly stumbled back and forth across the entire area from 10 a.m. to 4 p.m. without protective clothing. They were probably looking for physical finds and apparently believed that nothing could happen to them after two and a half years. Maybe they just forgot their clothes or didn't want to attract attention with them.

In any case, after they had returned to the USA, they all met the belated revenge of their old opponent.

Oddly enough, the general was the first to feel his strength failing after only a few months.

He is said to have died in 1950. He was 44 years old then.

Everyone else died too. One, the last one, turned 63.

This is said to have been in 1980 and he was without a doubt the toughest of them all.

[General] [...] must have written a report living a dusty and lonely existence in some American archive.

io8

There should definitely be aerial photos. Whether they will ever be released is another question entirely.

What about the death rate in the surrounding towns south of Auschwitz after the war and what did the people die of?

questions upon questions. If you try to answer them, new ones appear.

I hope they try."

We have, of course, attempted to verify some basic aspects of this unusual report which we are about to present for discussion - in particular the possibility that in the area south of the Auschwitz concentration camp (about 20 kilometers away, using this value as an *approximate* look at the information) and could carry out such an experiment somewhere north of the town of Kozy. We used today's technical and electronic possibilities to help, such as: Google Earth (satellite images) and Google Maps (digitized maps).

We also used some aerial photo databases to search for photos taken from the end of November 1944, but found that although photos of the Auschwitz concentration camp existed, the area south of it had not been recorded. Of course, that doesn't mean anything, because we were only able to carry out a random test. To estimate the effect of a nuclear detonation in this area, we used the NUKEMAP program.

* It can be used to simulate the effects of different levels of nuclear detonation on any environment, displaying both primary and secondary effects - including expected ones

fatalities and injuries. * With the help of this program it is possible, for example, to find out for the area of the so-called triangle at the military training area in Ohrdruf how far, for example, the primary and secondary effects of a mini nuclear weapon detonation reach - ergo the question of whether there (purely theoretically) such a test was even possible. To do this, you can enter the location or a nearby town and the detonation strength in the control panel (menu) of the program. For the example we have chosen of the triangle and the strength of the mini-detonation (we assume, as we have often mentioned in the general discussion, that it is well below 100, or to be precise 10-20, tons of TNT equivalent, which is roughly the smallest nuclear weapon ever built by the USA in the form of the »Davy Crockett«) the effect can be calculated and displayed. And lo and behold: the entered data presents a result that fits the triangle exactly. Coincidence? Hardly likely!

The biggest question marks that the report on the Auschwitz experiment raises in this context is a) the problem of the 4.5-kilogram plutonium charges, namely whether this amount is sufficient for a nuclear reaction at all, and, if so, point a would be able to be answered with yes, b) what percentage of these 4.5 kilograms of plutonium went into the chain reaction. If the information is correct, according to which two bombs, each weighing 4.5 kilograms of plutonium (Pu 239), were detonated, at first glance one should actually - if one considers the effect of the "Fat Man" nuclear weapon, which was dropped on Nagasaki, as comparison - expect a large-scale destruction.

* General explanations about this program can be found at: <https://www.techbook.de/easylife/web/nukemap-atombombe-simulation>

HO

However, this does not have to be the case, especially since one has to assume that the weapons used in the Auschwitz experiment were perhaps only prototypes, which, as is usual with such weapons, still had certain defects that can be seen under among other things, that they did not detonate at full power. But there may be other reasons for limiting the effects of a nuclear weapon detonation. We'll come back to that in a moment.

In general, it can first be stated that the problems with regard to the effects of a detonating plutonium bomb begin with the information on the quantity of plutonium bomb material used. The »Fat Man« is the best example of this.

Explanation: In older representations one finds for the Nagasaki bomb received information that 10-15 kilograms of Pu-239 were used in it. If one relies on this information, the amount of 4.5 kilograms specified for the Auschwitz plutonium bombs would of course appear to be far too small, so that the credibility of the report could already be questioned from this perspective. If one were to do this, however, one would have acted prematurely, because over the years this original value has been corrected further and further downwards, of which the German *Wikipedia* is the best example, as it currently writes about the »Fat Man« charge quantity:

»6.2 kg delta-phase plutonium alloy (mainly 239Pu, very small amount of gallium).«*

* https://en.wikipedia.org/wiki/Fat_Man (accessed April 24, 2019).

And the website *Nuclear Weapons AZ* informs:

“For a plutonium bomb to work precisely, the isotope 239 content must be at least 93 percent (weapons plutonium). However, warheads can also be produced with civilian reprocessed plutonium (reactor plutonium). The International Atomic Energy Agency estimates the amount required to be eight kilograms. The Natural Resources Defense Council in Washington disagrees: Even with relatively little technical knowledge, three kilograms of weapons-grade plutonium are enough. With a high level of know-how, even one kilogram is enough. Such a miniature bomb could devastate an entire city center. However, it is considered unlikely that this high level of know-how can be developed outside of the military laboratories of the superpowers. (Source: *Focus Online*, 19.9.1994).«

✱

Before you lose track, because even the experts do not seem to agree, it should be added that the authors of earlier reports may have always had the critical mass in mind, which according to current information is 10.0 kilograms for plutonium-239, if the bomb does not contain a reflector. If it has this, the critical mass is 5.42 kilograms. * ... However, only

✱✱

The website *Chemie.de* writes on the topic »unreflek oriented and reflected critical mass«:

* <https://www.atomwaffea-z.info/glossar/p/p-texte/artikel/foc7-cecic2/plutonium-bombe.html> (accessed April 26, 2019). ** https://www.chemie.de/lexikon/Kritische_Masse.html (accessed April 26, 2019).

*** Ibid.

“The higher the density, the lower the critical mass. An object has the lowest critical mass when it is spherical. A neutron absorber increases the critical mass, a moderator reduces it, as does a reflector such as beryllium, tungsten carbide or uranium-238. «

*

Because it fits so well, it should be mentioned at this point that we pointed out more than 15 years ago that the Reflector material beryllium was produced in the German Reich:

“Beryllium and beryllium oxide, which are now very useful materials for neutron return strahlmantel (NRM) were > coincidentally < produced in not inconsiderable quantities by Degussa during the Second World War, [...] while the USA had hardly any beryllium stocks with their Manhattan Project.

This can only mean that the scientists working on the American atomic bomb program did not recognize beryllium as the material for the neutron backscatter cladding, which in turn means that they did not perfect the fine art of building atomic bombs (reducing the mass of the nuclear explosive by means of tricky technical processes). not mastered at all.

However, German scientists must have been very well informed about the true nature of beryllium, otherwise Degussa would not have dealt with the

* https://wiviv.chemie.de/lexikon/Kritische_Masse.html (accessed April 26, 2019).

production of the material [...] involved. At the same time, it can be concluded that the way to minimize the critical mass was known in Germany and was therefore clear.*

It remains unclear at this point, of course, whether the Germans used so-called weapon or reactor plutonium at the time - we favor the latter. It is known that in the German Reich plutonium could be obtained by means of a reactor as well as by irradiation.

All in all, many questions remain unanswered, the clarification of which would possibly also explain why we did not make any progress on some paths of research. Thus, when examining the sections of land south of Auschwitz, including the areas to the west and east of it, we were able to find indications of an area in which extensive destruction, such as that caused by the detonation of the "Fat Man" plutonium bomb, was occurring expect would have been. Of course, that doesn't mean anything because, as I said, it's quite possible that far less bomb material went into the chain reaction and that the bombing effect was just so great that the built-up village was destroyed with it. (The nuclear weapons that were detonated were, as we have already established, little more than prototypes, which can be seen from the fact that two were used in the hope that at least one might work.) In addition, the Germans, with their familiar thoroughness, should have made sure that there are no or only very few traces that are difficult to interpret

* Edgar Mayer and Thomas Mehner: *Hitler and the Bomb. What stage has German nuclear research and secret weapon development really reached?*, Kopp Verlag, Rottenburg 2002, page 116. For the importance of beryllium see also pages 52-54, 115, 117.

of the attempt. In addition, the event happened more than 70 years ago, and a lot may have changed in the terrain structure in that time. Irrespective of this, it seems to us that there is enough space in the area mentioned for a scenario that only affects an area of 1000 by 1000 meters (or 1500 by 1500 meters). In addition, we know nothing about the test conditions in relation to the height of the bomb explosions above ground. Were the guns dropped from a plane? Were they placed at ground level? Or had they even been sunk into the ground, underground? None of this is known. It is also unknown whether cratering occurred. Should one have arisen, it was certainly filled in to cover up this conspicuous trace.

We also followed other leads: As we let know in this chapter, one of those who sat in the bunker and observed the Auschwitz experiment from a safe distance was Joseph Goebbels, whose name was later given to us.

* In the Joseph Goebbels diaries available to us, we found no indication of the whereabouts of the German propaganda minister for October 27, 1944. Goebbels entries were limited to October 12, 24 and 29, 1944; the next entry was on December 2, 1944. Other time overviews used did not clarify this question either. We then checked whether Goebbels might have been with Hitler on October 27 or 28, 1944 by trying to find out who the Reich Chancellor met that day and what program he was on

* Volume 5: 1943-1945, R. Piper GmbH & Co. KG, 2nd edition, Munich, October 1992

had graduated. * But no sign of Goebbels; we got no further in clarifying the question of where he had been on October 27 or 28, 1944.

Irrespective of our statement, it may be possible for others to find out where Goebbels was during the said period. However, it is difficult to judge whether this is the ultimate wisdom, because some contemporary witnesses with whom we had dealings years ago pointed out to us that in the Third Reich, if necessary, the service calendars or diaries were also kept of important people »cooked« or falsified in order to leave certain occurrences, visits or places of residence in the dark. To be honest, that wouldn't surprise us, since in the course of our research we had to find out again and again that certain important people who, for example, (allegedly) died in a bomb attack, were actually still alive and their important people tasks without continuing to be the focus of the Allies' interests. One such example we presented in our first book was a general with an unpronounceable name.

However, what struck us when studying Goebbels' entries was that in the weeks after October 27, 1944, something amazing happened to Hitler, who, after initially appearing rather depressed to Goebbels because of the entire war situation, even ill had been (which is why the propaganda minister was very concerned), had suddenly gained new strength and confidence, like a phoenix rising from the ashes.

* Harold Sandner, *Hitler. The itinerary. Whereabouts and Travels from 1889 to 1945, Volume IV, 1940-1945*, Berlin Story Verlag, 4th corrected edition, 2017.

Goebbels formulated the following verbatim in his diary entry of December 2, 1944:

»Yesterday: [...] I can only state with the deepest joy again and again that the Führer has become a completely different person. You hardly recognize him. If I still imagine that a few weeks ago I found him still so ill and frail in bed, when he was already developing the same big plans, albeit not with the verve that is happening today, then I can only say **that a miracle happened to him**. He is back on top of the situation and offers a rousing role model nationally

socialist militancy. He is, he tells me, in the process of instilling confidence in his military environment and those around him; because the generals are of course so depressed by the past setbacks that they can no longer really believe in the possibility of a great victory.« (emphasis added by the authors)

True: The war situation at that time (in the second half of 1944) offered no reason for optimism. If you just look at the description of the situation for October 26, 28 and 29, 1944, there was hardly anything other than threatening with regard to the situation in the German Reich

sound messages. The Anglo-Americans bombed major German cities with thousands of tons

Bombs because the Germans no longer had air supremacy:

»26. October: The US 8th Air Fleet continues its air offensive against Germany during the day. Hanover will

occupied with 776 tons, the Mittelland Canal attacked with 760 tons of bombs. Other targets are Munster and Bielefeld.«

»28. October 1944: On the night of October 28, fast British warplanes attack Berlin. British planes drop 2,699 tons of bombs on Cologne during the day. In addition, Münster and Hamm will be back attacked.« **

»29. October 1944: On the night of October 29, British planes drop bombs on Cologne and Munich. American bomber formations direct another heavy attack against Munich during the day, while British planes renewed their attack against Cologne in the evening hours.« ***

So what happened that made Hitler once again of the opinion that the tide of war could be reversed? We are certain: this transformed Hitler was the result of the successful test of a weapon that allowed him to deal with even an overwhelming enemy, and the presence of which made him believe in (final) victory again.

Shortly before the book went to press, we received a tip from Heiko Petermann, co-author of the book *Hitler's Bomb* (together with Dr. Rainer Karlsch) on the subject. According to this, in 2006, during research in

* Manfred Overesch: *The III. Rich. 1939-1945. A daily chronicle of politics • economy • culture*, Weltbild Verlag GmbH, Augsburg 1993, p. 548.

** Ibid., p. 549.

*** Ibid., p. 549.

Documentation Archive of the Austrian Resistance found a curious detail in connection with the concentration camp doctor * Hans Münch working in Auschwitz, who was tried but ~~acquitted~~ ^{**} after the war, and a Hungarian who worked under him.

According to the information, Münch was considered humane, and he was credited with rescuing many Jews who were under his direction at the Waffen-SS ~~Hygiene-Institut~~ ^{**} ~~Hygiene-Institut~~ in concentration camp.

The Hungarian who worked under Münch was himself a doctor and researcher, he was the physiologist Prof. dr Gezo Mansfeldt. After the war he wrote to Münch, who was on trial in an Auschwitz summary trial in Kraków in 1947, to a) support him and b) to share his experiences working with the Soviet and Polish commissions investigating the crimes of National Socialism to report. Included

he mentioned the following:

»I was the only living witness who knew about the hygiene institute, and so I was interrogated at least 2-3 times a week and of course had to drive to Rajsko a few times, but now in a nice car, to get there to show everything.

The various scientific commissions

It was difficult to convince me that poisonous gas and the like was not being manufactured there, **and what was actually suspected only became clear to me much later, when I heard about the atomic bomb**

* https://de.wikipedia.org/wiki/Hans_M%C3%BCnch_M%C3%BCnch (accessed May 13, 2019).

** https://de.wikipedia.org/wiki/Hygiene-Institut_der_Waffen-SS (accessed on i3._May.2019).

search learned. In other respects, too, I was quite a disappointment for the investigative commission [...].«* (emphasis added by the authors)

Unfortunately, the Hungarian was not more specific in his statement, so we have to state that with regard to the connection between IG Farben/Auschwitz/nuclear tests, further evidence was provided, but no proof. This indication, however, joins the ranks of the already existing ones, which sound unusual and strange - in each case considered in isolation, but in their synopsis point to an event that has remained largely unknown to this day and still more than Rumor as fact exists.

****** Readers of this book may be able to provide some assistance in clarifying the matter. If this cruel test actually existed and 20,000 people lost their lives, then then

*Professor Dr. Gezo Mansfeldt, Professor of [the] Physiological Institute of the University of Budapest, to Hans Muench, 5/12/46, USHMM1998.

A.0247: Roll 8. (Archive Heiko Petermann)

"It is possible that further references to the Auschwitz experiment could be found in the documents of the Kraków Auschwitz trial (https://de.wikipedia.org/wiki/Krakauer_Auschwitzprozess ') find. Or in the case files of the twelve follow-up proceedings to the trial of the major war criminals initiated by the Office of the US Chief of Counsel for War Crimes (OCCWC) between 1946 and 1949.

Case 1 in particular: Doctors' trial (https://de.wikipedia.org/wiki/N%C3%BCrnherger_%C3%84rzte_trial), case 4 already mentioned: Trial of the Economic and Administrative Main Office of the SS (https://de.wikipedia.org/wiki/Process_Wirtschafts-Verwaltungshauptamt_der_SS) or Case 6: IG Farben trial (https://de.wikipedia.org/wiki/Pr_o_zess_Wirts_chaftSzVerwaltungshauptamt_der_SS). (All four Wikipedia links were accessed on May 13, 2019.) However, given that the report we presented mentioned the elimination of unwelcome witnesses to the Nuremberg experiment, we have little hope of any other evidence, for example in the form of documents.

after more than 70 years it is high time to clarify their fate.

Even if the factuality of the report presented in this chapter cannot (currently) be proven, it still fits logically into what has become known so far:

- The fact is that IG Farben built a large plant in Auschwitz - for whatever reason.
- It is also a fact that the German scientist Paul Harteck knew that IG Farben had a process that was ingeniously simple and efficient in relation to a certain process technology related to nuclear technology. • Ultimately, it is also a fact that during the Nuremberg trials of major war criminals, Justice Robert H.

Jackson asked Albert Speer about an attempt at Auschwitz that made 20,000 Jews disappear.

This Jacksonian question is one of those oddities in time history that, had Americans been really clever, should never have surfaced.

Why did the American judge have to go into a document that was available to him at all, but which later did not appear anywhere in the files? Couldn't he talk to Speer about a "rumor circulating" that he had heard from some witnesses? Whatever the reasons for this strange manipulation, in hindsight it was an act that reversed the original purpose, namely to show that the Germans were not working on the atomic bomb, and which we now label as "stupid gone« archived

must become. Oddly enough, no historian has noticed this process, everyone accepted what happened and what Speer mentioned in relation to German nuclear research and did not ask about it.

Finally, with regard to the so-called Auschwitz experiment, we have to state that there is still a lot to do here. There are indications that this horrible attempt took place - but no one has really followed it up to date. Does the fate of those who died back then play no role? Or are people, especially in Germany, afraid of having to answer morally again for this particular war crime?

Nobody can change the past. The Second World War exposed the satanic face of all civilization - not just of those who committed crimes on the German side. The next chapter will document that the Anglo-Americans also pushed ahead with plans that stunned them because of their misanthropy.

*“Invincibility lies in defense.
The possibility of victory lies in attack.”*

SunTzu
(Chinese General)

Update 3: The German fear of the use of poison gas by the Allies

One of the questions we get asked most about the German atomic bomb is why, if it was there, it wasn't used.

If you want a greatly simplified and quick answer then one must point out that the German leadership was aware of the consequences of such an operation, since the Allies wanted to have threatened that if such a weapon was used, for example against London, they would assemble all their planes in North Africa (there was talk of up to 15,000 machines), fitting them with poison gas tanks and then having them flown to Germany, where the toxic gas was to be sprayed over large cities and other settlements alike.

Adolf Hitler, who himself had had extremely negative experiences with poison gas during the First World War, could well imagine that this would result in the deaths of millions of people. It was precisely for this reason, in our opinion, that he held back the bombs.

However, after Dresden had been destroyed by completely senseless terrorist attacks by Anglo-Americans, he thought he had to conjure up a kind of twilight of the gods - he wanted to use the nuclear weapons of the Reich.

However, he reckoned without the German made resistance that controlled and held back the atomic bombs, but would probably have used it himself if the An

Over the years we've gotten to it again and again addressed whether the account we were circulating of a concentrated poison gas attack by the Allies on Germany from North Africa could be verified by documents. All we can say is that this story was presented in a few books, which in turn did not provide any precise source information.

* After the catastrophe, which we now intend to present in more detail, it was kept secret by the American side, as it was anything but a glorious page for them, but it was

* There are a number of accounts of the attack by the German Luftwaffe on the port of Bari and the resulting consequences. In book form, for example: Glenn B. Innfield: *Disaster at Bari*, Mac Millan Publishing Company, 1st Edition June 1971. (An excerpt of the book can be found on the Internet at: <https://www.americanheritage.com/disaster-bari-o> [Accessed 26 April 2019].) Or Gerald Reminick: *Nightmare in Bari: The World War II Liberty Ship Poison Gas Disaster and Coverup*, Glencannon Press, 2008. The disaster is reported online at: <http://homebrewedmojo.blogspot.com/2018/12/air-raid-at-bari.html>, https://www.wikitree.com/wiki/Space:Bari_Raid—in_World_War_II (with numerous images) and <http://www.bariharbor.org/> (each retrieved on April 26, 2019).

a top proof of their cruel plans against the German Reich and its people.

In the decades after the war, attempts were made to Disaster "Made in USA and Great Britain" in its meaning to trivialize or downplay the issue, but we think it's time to call things by their proper name: the Germans, who were accused of collective guilt after the war, have every right to point the finger at others to show their morality and humanity, among other things, in the alleged use of their own nuclear weapons against Japan - and that twice! the malicious plan behind it.

-, so you only get one

*

On the afternoon of December 2, 1943, a German Messerschmitt Me-210 reconnaissance aircraft flew over the port of Bari in south-eastern Italy. The machine flew at an altitude of almost 7,000 meters and produced a telltale vapor trail that should have worried the opposing flak crews, but they apparently saw no threat in the single machine. Completely unmolested, the Me-210 flew over the 200,000-population city a second time before heading north and disappearing from the sight of those who had spotted it from the ground.

The German pilot had seen enough.

As for Bari itself, the port city was hardly attacked during the war because the Allies needed it as a ship landing place for their military and freight transport in the event of an attack on Europe or the German Reich.

Italy surrendered to the Allies at the end of September 1943 and entered the war against Germany on October 13 of the same year. The Italians obviously had no problem with such an abrupt change of sides.

As 1943 drew to a close, Bari's medieval tranquility was being shattered by the activities of the British and Americans, who were transporting dozens of tons of military hardware and supplies.

On December 2nd alone, at least 30 ships moved into the port, so it was feared that they would collide with each other.

The port itself was under the jurisdiction of the British, partly because Bari was the main supply base for the Eighth Army under General Bernard Law Montgomery. But the city was also the newly named seat of the American Fifteenth Air Force, activated in November of that year. Their main task was to bomb targets in the Balkans, Italy and especially Germany. The commander of the Fifteenth, Major General James H. Doolittle, had arrived in Bari on December 1st.

In addition to the usual war material, the ships that landed in Bari mainly brought fuel for Doolittle's bombers and other much-needed supplies. The choice of Bari as the headquarters of the Fifteenth Air Force meant that around 200 officers, more than fifty civilian technicians and several hundred soldiers were also stationed in the city. They were all so busy with the task of transporting and distributing material that hardly any of them believed that the Germans could attempt an attack on the port. However, as experience teaches, belief is not knowledge.

The now and again to be observed German reconnaissance

Flights over Bari had first been answered by having a couple of British anti-aircraft batteries fire a few rounds. However, since no direct military threat was discernible and it was also believed that the German Air Force was weakened, the German machines in the sky were eventually completely ignored. Of course, there was criticism of this measure, and some officers thought that neglecting security measures could have unpleasant consequences. The British army captain AB Jenks, who is responsible for defending the port, informed, for example, that the preparations for repelling a German attack were completely inadequate. No measures have been taken to compensate for a power outage caused by enemy fire or enemy bombardment, should the worst come to the worst.

Instead, the ships were even unloaded at night and the relevant port areas or docks were brightly lit during the day, so that the whole thing looked like Christmas or holiday illumination in an otherwise dark night.

In order to emphasize the carelessness and know-it-all attitude of certain superiors, the second highest ranking British Air Force officer, Air Marshal Sir Arthur Coningham, even held a press conference on the afternoon of December 2, at which he assured the journalists present that the German Air Force in Italy defeated and therefore an attack on the port of Bari is not to be expected.

Coningham went so far as to claim that it would be a personal insult for the Germans to attempt an attack.

Cargo ships and tankers were waiting in the port of Bari up to be discharged. Among them was the *John Harvey*, commanded by Captain Elwin F. Knowles

en. No one suspected anything unusual or special about this ship. In fact, a large part of their cargo was of a purely conventional nature, namely equipment, ammunition and food for the fighting troops. What hardly anyone knew, not even the captain: the ship was also carrying a deadly secret cargo. On board were at least 100 tons of mustard gas bombs (Der *Spiegel* was even supposed to speak of 540 tons in an article published in October 1988; more on that later).

It was later falsely claimed that these had been transported to the European continent as a precautionary measure in case the Germans, for their part, resorted to chemical warfare methods - and were the first to do so. In this context, the Allied authorities were of the opinion that the Germans, who were on the defensive after the defeat at Stalingrad, would resort to poison gas to ward off the onslaught of their opponents. It was little more than tactical banter to give the impression of trying to prevent the situation from escalating.

Appropriately, US President Franklin D. Roosevelt issued a policy statement in which he strongly condemned the use of gas by any civilized nation, but nonetheless promised that the US would respond equally if the enemy dared, first to use such weapon systems. The Germans are probably the best judges of what to think of such statements from Washington: We would just like to remind you of US President Wilson's 14-point program in connection with the end of the First World War. The Germans relied on it and paid

expensive for it. Anyone who trusts the USA has built on sand.

Just this much for the moment: The poison gas shipments to Europe were part of a US plan called G-Day to force Germany to end the war. We'll come back to that.

When the bombs with the mustard gas were loaded on board the *John Harvey*, this was not noticed, as they looked like conventional high-explosive bombs. No one cared about that, after all it was war and bombs were something that loading crews as well as ship crews saw regularly. Since the delivery of the mustard gas bombs was classified, the ship's captain, Knowles, was not informed either. The only thing that could have aroused suspicion was the fact that seven men came on board with the cargo, obviously aware of what the bombs contained. But the ship's crew didn't think too much about it, everyday life and the hope of surviving the voyage on the high seas under wartime conditions had other priorities.

The *John Harvey* crossed the Atlantic without incident. After a stopover in Oran, Algeria, the ship proceeded to Augusta, Sicily before setting course for Bari. The original plan was to unload the ship's problematic and secret cargo immediately after it landed in Bari - the ship reached the port on November 26, but that didn't work, we were

-,

Dozens of ships arrived there, also waiting to be unloaded. As no one in the port authorities was aware of the *John Harvey*'s special cargo, she was given no priority and the ship was forced to remain anchored at Pier 29 for the next 5 days. The captain tried to expedite things, but the officials of the port authorities did not listen to him, especially as he

couldn't come up with a reason why his ship should be given priority.

During this time, the German reconnaissance flight described above took place, and the pilot's positive report was to set things in motion that finally culminated in the attack on Bari. The Bari attack was the result of a planning session between Luftwaffe Field Marshal Albert Kesselring and his subordinates.

Initially, Allied airfields near Foggia were considered as possible targets, but the Luftwaffe's resources were insufficient to successfully bomb such a large complex of targets.

It was Field Marshal Wolfram von Richthofen Commander of Air Fleet 2, who suggested Bari as an alternative. Wolfram von Richthofen, a cousin of famed World War I ace Manfred von Richthofen, was a veteran officer who had served in Poland and the Soviet Union, as well as in the Battle of Britain.

Kesselring knew his advice was sound. Richthofen believed that if the port were paralyzed, the advance of the British Eighth Army would be slowed and the bombing offensive of the Fifteenth Air Force, which was beginning operations, would be delayed. Richthofen informed Kesselring that, in his opinion, the only aircraft available for such a task were his Junkers Ju-88-A-4 bombers. With any luck, he could assemble 150 of these machines for the attack.

What prioritized this attack was the fact that German reconnaissance had received indications that chemical warfare agents were on board the ships landing in Bari.

Ultimately, there were not 150, but only 105 Ju-88 machines available for the attack on Bari. The

Those responsible on the German side believed, however, that on the one hand the element of surprise and on the other hand the attack, if carried out at dusk, offered good chances. In addition, they wanted to mislead British air defenses by giving the impression that the bulk of the German aircraft were coming from the west instead of from the north. The Ju-88s were also fitted with chaff, thin strips of aluminum foil of various lengths which, when dropped, jammed British radar systems by producing a multitude of phantom targets.

The Germans arrived in Bari with their planes around 7.30 p.m. First Lieutenant Gustav Teuber, who led the first wave, could hardly believe his eyes: the docks were brilliantly lit and it was easy to see details such as open ship holds.

The first bombs hit Bari itself, but the German pilots reacted quickly and devoted themselves to their actual target: the approximately 30 ships lying in the port. The surprise was a devastating total, and one could get the impression that a second, albeit smaller, Pearl Harbor was in the making. Some of the ship's gun crews fired their missiles into the sky, joining the barrage opened up by the shore batteries. The tracers ripped through the sky, but were pretty ineffective.

But the German bombardment was all the more successful. One ship after another was hit. The port turned into hell: flames, smoke, explosions everywhere.

The crew of the *John Harvey* tried their best to save the ship. It was still relatively intact as there was no

had received a direct bomb hit. But it caught fire. Eventually, without the slightest warning, the *John Harvey* exploded, only to disappear in a massive fireball that ejected parts of the ship and cargo. All on board were killed instantly, while the blast knocked over people fleeing the disaster in the port area like cardboard cutouts.

If only it had been this blast that people injured, history would have included the attack on Bari as just one case among many. But now some people in the immediate vicinity noticed that they were getting trouble breathing. One sufferer said, "I smell garlic" - a telltale sign of that

Appearance of mustard gas that would eventually affect hundreds if not thousands.

The German attack, carried forward with only minor losses, lasted about 20 minutes and exceeded all expectations. Seventeen ships were sunk and another eight were damaged. The Americans suffered the heaviest casualties. The British lost four ships, the Italians three, the Norwegians three, and the Poles two.

It wasn't until the next morning that it became apparent how severe the German bombardment had been - chaos and devastation reigned everywhere. Large parts of Bari had been reduced to rubble, especially the medieval old town. Parts of this and the harbor were still burning, and a thick wall of black smoke hung in the sky. The casualties of dead and wounded among military personnel and sailors amounted to at least a thousand. Three quarters of them, that is 800, were taken to nearby hospitals. The exact toll the civilian population had to pay in blood has never been determined

been. Conservative estimates put the number of victims at around a thousand. But there were probably more.

It was - at least that's what it seemed at first - still lucky in misfortune. In fact, Bari was the site of several military hospitals and associated facilities

directions. For example, the 8th British General Hospital and the 3rd New Zealand Hospital were located here. These took in many of the mustard gas victims, although the doctors treating them had no idea that those admitted had been harmed by mustard gas. Their condition deteriorated rapidly: their eyes swelled, skin lesions developed, and the patients suffered from severe breathing difficulties. The hospital staff seemed helpless in the face of this unknown illness.

When the first victims began dying, doctors suspected that some type of chemical agent or warfare agent was the cause, but they didn't know for sure. Some medical professionals speculated that the Germans had resorted to chemical warfare after all. A message was sent to Allied Headquarters in Algiers, informing Deputy Surgeon General Fred Blesse that the patients were dying of a "mysterious disease." Blesse then sent Lieutenant Colonel Stewart Francis Alexander, an expert in chemical warfare medicine, to Bari.

Alexander examined the patients and questioned them as much as possible. Gradually, more and more evidence was found that spoke of mustard gas poisoning, but the doctor wasn't entirely sure. His suspicions were only confirmed when a fragment of a bomb casing was found in the port area, which was identified as the remains of an American M47A1 bomb intended for the delivery of mustard gas. The Germans therefore had to

Suspects leave, so the Allies were responsible for the incident.

When the telltale bomb fragment appeared, Alexander still had no information about where, that is, which ship, the mustard gas bombs came from.

Therefore, the doctor recorded the number of mustard gas deaths for each ship and then plotted the position of all ships up in the harbour. As he eventually found out, most of the casualties were from ships anchored near the *John Harvey*. British port authorities eventually admitted they knew the *John Harvey* was transporting poison gas. Alexander prepared a report setting out his findings, which was approved by Supreme Allied Commander General Dwight D. Eisenhower.

But who believes that the public is now over truthfully informed of the incident is wrong: secrecy has been maintained in relation to the most important aspect of the disaster. The British and American people

was briefed on the devastating Bari attack, but all aspects related to the deadly mustard gas were suppressed. British Prime Minister Winston S. Churchill played a particularly nasty role in this: he adamantly insisted that this aspect of the tragedy must remain a secret. It was extreme for him

embarrassing that the German Luftwaffe attack happened in a port under British jurisdiction. Churchill was of the opinion that if all the circumstances of the catastrophe were made public, this could be exploited by German propaganda with every trick in the book.

Allow us an excursus at this point: if the British Prime Minister Winston Churchill is already in a case

how the German attack on Bari concealed decisive circumstances (the secrecy regarding the mustard gas bombs was only lifted years later), what classification measures can be expected if the Allies found the weapons in German underground facilities after the war with which they might End of 1945, beginning of 1946 would have been finished? Would you admit that? We think: no, because in hindsight that would have been an (indirect propaganda) victory for the German side, which only did not come about because of a lack of time, but not because of the - according to the historiography of the Allies - and those who voluntarily submitted to them German establishment historians postulated - a lack of economic, financial and scientific-technical performance. We believe that after the war, the Allied loot teams, seeing the second-generation German wonder weapons and their mostly underground

established production facilities were so frightened that they decided that their propaganda must convey to the defeated Germans for decades to come that - as we already mentioned in one of our earlier books - they were "totally, totally defeated" and the mention of a history of the war still changing miracle weapon (baseless) Goebbelsche propaganda was. At the same time, the Allies wanted to prevent the emergence of a (otherwise justified) legend of the stab in the back, which would have been based, among other things, on the fact that there were forces in the German Reich that committed treason and sabotage to an extent that was unprecedented in world history was. When we put it this way, we always want to keep in mind that many innocent people, i.e. civilians (children, women, elderly people), died as a result of the treacherous activities of the resistance, who - man

may wonder - usually play no role in contemporary historical considerations in this regard. Why not? When will a (government-funded?)

Study launched that determines the number of victims who are responsible for the German resistance? - We are of course aware that something like this will never happen in a country in which left-green leanings can demand »Bomber Harris, do it again« with impunity.

*

The perversities know no bounds: we must ask ourselves what's going on in minds (if anything is going on in them at all) that profess such things.

If the military break each other's skulls, that's their problem. However, if civilians become victims of warlike violence, this is unacceptable. The followers of the "Bomber Harris, do it anyway" slogan also forget that the Allied carpet bombing in the Second

World War II also killed many Germans who were declared or secret opponents of National Socialism and Hitler. Bombs made no difference. But maybe

one hopes in this country within certain structures that the successors of Bomber Harris will in future use bombs with artificial intelligence that only kill those who are opponents of the state-imposed worldview, freethinkers or opponents in general.

So back to the Bari case and Churchill's

Machinations: Although mustard gas was mentioned in official American records, British ones existed

Prime Minister insists on British medical records being cleaned up and the mustard gas deaths from burns

* See: https://www.focus.de/politik/deutschland/bomber-harris-do-it-again-dieser-nackt-protest-gegen-pegida-schockt-dresden_id_4420184.html (accessed on April 25, 2019).

had to be listed. The whole thing was particularly perfidious in that the concealment of the true circumstances provoked further deaths, since Italian civilians, for example, who were also affected by the poison gas, could not receive appropriate treatment afterwards. How could a doctor who had no special training in the "effects of warfare agents" correctly classify the symptoms of his patients from Bari?

According to official accounts, more than 600 military personnel and sailors were killed in the mustard gas release. Almost seventy of them died, while the others, after sometimes long and agonizing treatment, were able to recover. The number of those affected remained unknown

Civilians exposed to the deadly chemical.

After the German air force attacked Bari, many of them fled the city to find shelter with relatives and friends in the surrounding area. No one has counted the number of those who died or became ill as a result of exposure to the mustard gas.

The »Bari« case is an example of how human lives played no role when it came to the secrecy interests of representatives of the so-called elite. But, even if it may sound cynical at first, there was something good about it, because the Anglo-Americans subsequently became much more cautious when it came to dealing with poison gases, fearing a repeat of the Bari disaster.

And it probably contributed to the fact that plans by the US military for a so-called G-Day (gas day) based on D-Day were not implemented.

What are we writing about? Well, relatively little was known about the attack on Bari and the background to it in Germany. No wonder, because the planning behind it takes your breath away when

one learns of them, but they refute the saga of the morally superior US military with clear numbers.

None other than the then news magazine *Der Spiegel*, still known in the 1980s as the "spearhead of democracy" and provided with journalists who were concerned, at least to a large extent, with presenting the facts, reported on what the Bari able to prevent attack.

In the article »From Heaven High. A secret plan reveals that towards the end of the war, the Americans were ready to destroy a large part of the German population with poison gas," *Der Spiegel* reported on October 24, 1988, describing the fate of the German Reich and its people

should overtake. The article is on the one hand the proof for that Hitlerian fears (in relation to an Allied retaliation provoked by whatever weapon of mass destruction) and, on the other hand, proof of the brutal means with which the Allies intended to throw down Germany - with millions of dead as collateral damage.

The Spiegel article first dealt with the events in Bari, which we have described in detail on the previous pages, and then referred to the secrecy measures associated with them. He then explained that the background to the »Bari disaster« was a closely guarded secret, referring to the historian and poison gas expert Günther Gellermann. It was also mentioned here - we had the be

already shown - that those dealing with the case
Military historians assumed that the landing of poison gas in the port of Bari was intended to

* The article is available online at <https://www.spiegel.de/spiegel/print/d-i353i6g6.html> (accessed 29 March 2019).

to effectively counteract a possible German poison gas attack.

As it turned out, however, this assumption could hardly be reconciled with the facts. *The mirror* wrote:

»First a chance find by the Württemberg private researcher and specialist author Fritz Hahn 66, in a *,
Washington archive reveals the drama of a
Planes, which the US warfare immediately after the > first use of gas
by the Axis powers <
(>G-Day<) wanted to realize. After that, from Italy and England,
thousands of planes were supposed to "in a 15-day operation" • fog
30 major German cities with mustard gas and/or the even more toxic
phosgene, • bomb all important industrial and manufacturing plants
and thus start the Second World War in Europe end in one fell
swoop."

As was further reported, such a mass attack would of course have had terrible consequences. According to *Der Spiegel*, US chemical warfare specialists had calculated the number of casualties and given 5,600,000 dead ('directly affected') and 12 million injured ('would be indirectly exposed to the proposed attack').

Read the last sentence again and think about it
after him: Over 17 million Germans would have been affected by
the consequences of the G-Day project!

* Fritz Hahn became known as the author of the book *tVa/jfen and secret weapons of the German army 1933-1945*, 2 volumes, Bernard & Graefe Verlag, Koblenz 1987.

If one considers the magnitude that the Allies planned in connection with G-Day, one has to realize that the probably most effective weapon system of the Second World War would have been chemical warfare agents had the worst come to the worst. Numerous nuclear weapons would have had to be used to arrive at the number of casualties given for Operation G-Day.

It seems all the stranger at first glance that there were efforts to develop this both in the USA and in the German Reich.

However, this contradiction is only an apparent one, because atomic bombs would not only have life if they were used destroyed, but also severely damaged the infrastructure, which would have been preserved if poison gas had been used. Ergo, a nuclear weapon would have been the weapon of choice to spread the greatest terror, since there was virtually no protection against it, and the consequences for a larger urban settlement would be catastrophic, not least because of the radiation released and the fallout been. In addition, this deadly weapon could have been transported to the target with a single aircraft or - "even better" - with a rocket that was difficult or impossible to intercept.

Fortunately, the calculations for G-Day remained just simulation games. Neither the Germans nor the Anglo-Americans used their poison gas stocks - tens of thousands of tons. In fact, in 1944 and 1945—and not only when both Americans and Russians possessed atomic bombs—one must speak of a balance of terror. However, it can be assumed that if the Germans had actually directed a nuclear weapon against London, Churchill would have unhesitatingly rained down the poison gas over German territory. In a letter to General Ismay dated July 6, 1944 (for the

Committee of Joint Chiefs of Staff) never wrote Churchill what he intended to do if the British got into trouble later in the war: "[...] I want you to think very seriously about the problem of gas application . [...] It is absurd to look at the issue from the moral side [...]. I wish that a cold-blooded assessment be made as to whether it would be favorable for us to use poison gas [...].« * Under paragraph 7 of his letter to the British General

...

Churchill made it clear that if it came to "poisoning Germany with poison gas," then it should be "one hundred percent." And: "In the meantime, I wish that the matter would be thought through by sensible people in cold blood, and not by those psalmodizing uniformed defeatists that you come across every now and then [...]." As *Der Spiegel* writes, would have Churchill's military, however, held back. Maybe they also thought, and this is our guess, that a prime minister who loved alcohol wasn't the final decision

may leave.

In general, one gets the impression that the military, both Axis and Allied, were the only ones who kept a cool head during World War II. If they had given in to the politicians' ideas, large parts of Europe might have become uninhabitable.

"And lisp in English when they lie."

Johann Wolfgang von Goethe

Resistant to new facts establishment media **CONTINUE AS BEFORE**

Sometimes irony is needed to deal with the topic »German atomic bomb«: We can consider ourselves lucky and thank our creator that we have the Americans as friends. Otherwise we would know

maybe not that the Germans came second in the race for reactor technology and nuclear weapons during World War II. So that we don't forget that, the German establishment media keeps stirring up the (cold) old, long outdated mush of information, which has a lot to do with propaganda but hardly anything to do with the truth, sometimes energetically differing from scientific ones Experts from God's own country, ie the USA, are supported.

One of the most recent examples of this can be found on the n-tv website and was titled on May 6, 2019 as follows:
»Recognition by US researchers. Nazis could have built nuclear reactors.«

pot thousand! What great news!!! We were quite astonished, although it wasn't this old camel that made us astonish, but the fact that something that had been well known for decades was sold as news: the (planned) reactor test in the Swabian Haigerloch at the end of the war, the uranium cubes used there and the heavy water as well as the long established fact that if this reactor had more of these metal cubes and also a larger amount of the moderator

Heavy water decree would have become critical. However, because the two materials mentioned were not available in sufficient quantities, the reactor test failed - perhaps fortunately for Haigerloch and its residents.

n-tv reported highly exclusively on the background of the US expert research:

It all started with a small, dark, and unusually heavy metal cube that landed on the desk of University of Maryland researcher Timothy Koeth in 2013. An accompanying mysterious message read: 'From the reactor Hitler tried to build. < This set a re

search work in progress, at the end of which Koeth and his colleague Miriam Hiebert came to the conclusion: >The Germans could have built an atomic reactor<, they report in the magazine *Physics Today* *.«*

The fact that something so nonsensical is still published in a physics journal gives a deep insight, especially since the statement »The Germans could have built a nuclear reactor« in itself is completely wrong: Of course the Germans built a reactor (even several), only they couldn't get the one to work in Haigerloch because, as we have already established, there was not enough material in the form of uranium cubes and heavy water.

The article then used the old, well-known clichés again: while the Americans pooled all their strength,

* <https://www.n-tv.de/wissen/Nazis-haetten-Atom-Reaktor-bauen-koennen-article21006598.html> (accessed May 8, 2019). ** <https://physicstoday.scitation.org/doi/10.1063/PT.3.4202> (accessed May 8, 2019).

In order to develop a) a working nuclear reactor and b) their atomic bomb, the Germans worked in different groups (three are named), which worked in Berlin, near Gottow and in Leipzig. (Curiously, mention has been made of activities in Bohemia-Moravia, Silesia, Thuringia, northern Germany and elsewhere.)

Due to this fragmentation of forces and other alleged reasons - just as often described - the construction of a German nuclear reactor proceeded extremely slowly. The model in Haigerloch could perhaps have become critical if, if, in addition to the 660 uranium cubes used there, 400 more had been delivered, for the existence of which the above-mentioned Americans had found evidence in files discovered in the US National Archives found (the only news, if any, worth mentioning).

One can only shake one's head in the face of such efforts and representations, the authors of which have still not understood that the whole Haigerloch story was nothing more than a diversionary maneuver and, moreover, has not offered any news for decades. The well-known writer Franz Kurowski expressed himself - and was there he was by no means the first - more than 35 years ago in his book *Unconditional Surrender. Inferno in Germany 1945** on page 289 as follows on the subject:

"[...] Prof. Dr. Gerlach now went to Haigerloch to see for himself how things were there.

He then returned to Stadtilm and gave instructions to load all the material onto trucks and

to get to Haigerloch. With the leadership of this convoy, Dr. commissioned by Erich Bagge. Dr. Wirtz also drove to Haigerloch with the material transport. The column arrived there at the end of February. With it Heisenberg in Haigerloch had 1.5 tons of uranium cubes, 1.5 tons of heavy water and 10 tons of graphite cubes at his disposal. These were finally filled into the new nuclear reactor B VIII. It was installed in a cave near Haigerloch. At the end of February, the uranium pile arrangement for the last large-scale test was ready. Prof. Dr. Heisenberg and Dr. Wirtz led this attempt.

It turned out that this uranium pile far surpassed all previous tests. It was now possible to calculate the critical point at which the reactor became critical, meaning it could generate energy independently. A chain reaction was definitely within the realm of possibility. But then the pile did not become critical, fortunately for the scientists involved. The protective devices in no way corresponded to the dangers that would have arisen.

You had to put more heavy water and more uranium in the reactor for it to finally become critical.

But they didn't get that far in Haigerloch, because twice the amount of heavy water and uranium needed was no longer available.«

According to this, everything that the n-tv article and the two US experts were now trying to present as the results of their research as news was already known in 1983. The question may be allowed: what is the point of all this, unless one assumes that the old wrong, established

The writing of history in relation to German nuclear (weapons) research should be polished again so that those who are interested in it do not have strange ideas and believe our representations.

As we have already written, the procedure of constantly polishing up the old, the wrong, in order to pretend that it is about "secure knowledge" has a decades-long tradition in Germany.

10 years ago, on March 19, 2009, *Der Spiegel* also published an article regarding German nuclear (weapons) research conducted during World War II, which attempted to discredit the German achievement by simply claiming that the Americans had completely overestimated the possible German advances in the field of physics. And again it was about a uranium cube or a fragment of it and also about a uranium metal plate.

The headline of the article was "Nuclear Forensics.
* "Heisenberg-Würfel" reveals details about Hitler's atomic program," and the statement summarizing the article said: "Karlsruher researchers have new knowledge about it how far the Third Reich's nuclear program had really progressed. Uranium samples from the last lab tell the amazing story of the project - the United States was wrong in its assessment of Hitler's scientists.' Which means the Americans stood in vain
Fears related to a German atomic bomb. This did not exist because the German scientists did not even succeed in making a reactor critical.

* <https://www.spiegel.de/wissenschaft/mensch/nuclear-forensik-heisenberg-wuerfel-verraet-details-ue-hitlers-atomprogramm-a-614227.html> (accessed May 2, 2019).

The subject of the investigations discussed in the *Spiegel* article was, as we have already mentioned, a uranium cube and a Uranium metal plate from Heisenberg's inventory, which, however, was never the subject of a running reactor:

"The intact cube and the fragment were produced by autumn 1943 at the latest, and the uranium plate by mid-1940. The researchers were able to assign the samples to the Joachimsthal uranium mine based on the chemical impurities. But the most important result: "The cube hardly got any neutrons," says Mayer [one of the scientists involved]. This suggested that the Uranium Association was "far from creating a self-sustaining chain reaction."

Therefore, the article also came to the conclusion:

»The analyzes also yielded a key historical finding: as far as the material examined reveals, Heisenberg and his colleagues did not succeed in producing any plutonium. If scientists had wanted to create a nuclear weapon, it would have been technically easier to build it from this substance. But in the samples, the Karlsruhe scientists looked in vain for plutonium that came from a reactor."

Strictly speaking, none of this was new, but already well-known. For the majority of people reading this article, it was clear what they had known for decades anyway: there was no German atomic bomb, although German science had laid the foundations for it, it was then far behind the level of the US Americans

ican developments. However, this conclusion forgot to mention that Heisenberg was not the authority in the German Reich to be entrusted with such a project. There were others who made it and who generated the success in the strictest secrecy and with false identities.

Of course, such representations, as published by *Spiegel Online* and repeated by *Welt Online* on March 25, 2009 in the article "How far was Hitler on the way to the atomic bomb?" One of us published on *Kopp Online* on March 26, 2009 in reply,

*** which is to be shown here:

»Our daily dumbing down by quality media:

Scientific research, wrong conclusion

wrestled AND THE STRONG ATTEMPT, AN INCORRECT one

to maintain contemporary history writing

[by] Thomas Mehner

Germany was miles away from a working nuclear reactor in World War II. A nuclear weapon was out of the question and the Americans were wrong

totally different in relation to such a German weapon system - according to the (again wrong) conclusions of German quality media that could be read recently after two German uranium metal samples from the

(accessed May 7, 2019)

** The website no longer exists, but the article can still be found here, for example: <http://wahrheitskrieg.blogspot.com/2009/05/der-spasmodic-attempt-an-incorrect.html?mi> (accessed May 7, 2019).

1940s by the Institute for Transuranium Elements (ITU), Karlsruhe.

A few days ago you could read *Spiegel Online* or *Welt Online* - and the report was published by other (quality) media that, based on investigations into relics of the >atomic reactor< in Haigerloch, which was under construction at the end of the war, and based on a uranium metal plate that had already been manufactured earlier, scientific proof had now been provided that the German nuclear weapons project was more or less a pipe dream of American institutions. The reactor in Haigerloch never went critical; nor does the examination of a previously manufactured uranium metal plate indicate that plutonium could be produced.

the scientific ones Research results in themselves (and only these) are not to be criticized. But what *Spiegel Online* and others then made of it was astounding - and is certainly likely to provoke criticism and be questioned. The Internet source just mentioned stated right at the beginning of their article: >Karlsruher researchers have new ones

Findings were gained about how far the Third Reich's nuclear program had really progressed. Uranium samples from the final lab tell the amazing story of the project - the US was wrong in its assessment of Hitler's scientists

Interesting: Two tiny material samples gave Evidence that the state of affairs in So WWII on the German side was what establishment historians have always said

had postulated. What a shame for the American secret services! If you follow the *Spiegel Online interpretation*, i.e. on the basis of a rumor about the German nuclear weapon, they had built their own insane project to build an American nuclear bomb - the so-called Manhattan District Project - out of the ground and spent a huge sum for it as well as countless resources wasted. How terribly stupid, how unqualified!

But seriously, it's not that simple. What do the scientific research results really prove? They only show that the atomic laboratory in Haigerloch did not contain a reactor that had become critical and that the uranium metal plate, which is said to have been produced around 1940, was not subjected to any process that could be considered critical.

That's all.

It is noteworthy that the media still and always only refers to the Heisenberg Group or to the research at the Kaiser Wilhelm Institute (KWI) in order not to have to include other information that has become known in the meantime in the considerations. whereby it is now obvious that Heisenberg played a completely subordinate role as a theoretician.

His project at Haigerloch was the diversion intended for the Allies: unfinished, insignificant, misleading.

The 'bomb' was created by other experts, some of whose names remain unknown, some of whom are as good as forgotten today. By the way: What about the experimental reactor in Gottow near Berlin, what about Stadtilm, what about others (in Thuringia).

genic locations that would have to be subjected to close inspection and investigation? Why is the group around Dr. Diebner, who worked or let work in Gottow and Thuringia, paid so little attention? Why is nobody interested in the projects related to German nuclear research and nuclear weapons that were implemented by big industry, for example at Skoda, which at the time belonged to the Krupp concern?

Why isn't a representative of the quality media researching the work of the Deutsche Reichspost under its Minister Dr. Ohnesorge, who was himself a trained physicist and from 1943 at the latest with Reichs

The experimental reactor in the Swabian town of Haigerloch, which was dismantled by specialists from the ALSOS mission.

He had never become critical due to the lack of material.

(Public Domain, Wikimedia Commons)

**In this concrete construction near Gottow was once the
Diebner's experimental reactor, which became critical.**

(Photo: archive authors)

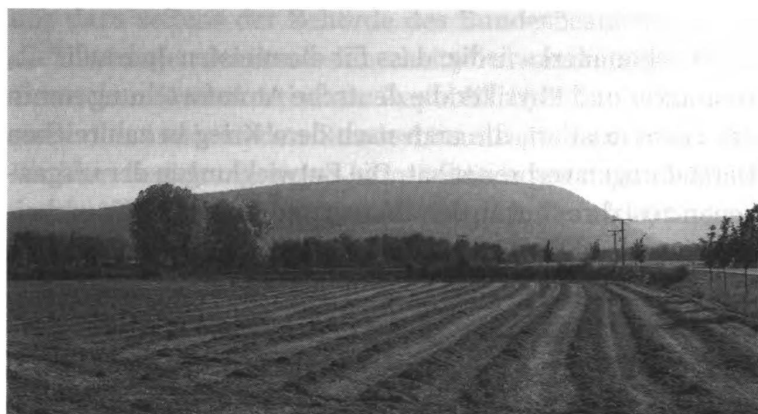

fuhrer SS Heinrich Himmler and his Schutzstaffel worked to realize the atomic weapon? Why were investigations (drilling) in the area of the Thuringian Jonas Valley and an area west of Arnstadt blocked by making the area a drinking water protection zone, level 2, effective December 2007, after which such explorations had to be stopped?

The representatives of quality journalism wipe away such questions with a wave of the hand and only speak of "rumours", apparently because they suspect that they themselves have been taken in by the Allies' disinformation for decades. Critical contemporaries know, however, that the journalists' reaction is purely a protective mechanism, which is used whenever the establishment representatives -

and most journalists are now part of it - have to fear that their world view could crack. It is no longer about searching for the truth; it's just a matter of preserving points of view and "certainties" that are useful for the political system and not offending anyone if you want to continue your career. Everything has to be politically correct, which, if I may say so, strongly reminds me of the GDR era, where >a clear class standpoint was required and other opinions were considered subversive. Of course, the interested citizen finally notices the fraud and rightly speaks more and more often of "propaganda" and promotion of general stupidity in relation to German journalism. The fact that the so-called quality media are taking the lead is surprising in itself, but it shows how sick the situation is.

The fact is that in the area around the Thuringian military training area in Ohrdruf, construction work had been going on since the 1930s to create underground facilities that were intended to serve special research, after the Reichswehr had already taken highly secret measures in the area around the city of Ilmenau in the 1920s had to circumvent the provisions of the Versailles Dictate. The German Navy not only continued to develop the submarine weapon there underground, but also carried out other investigations in the near and far surroundings, which unintentionally led to an explosion in 1924 near the small town of Munich (not to be confused with the Bavarian capital) led, as a result of which nuclear research began to be dealt with in more detail.

Unfortunately, this is not the place to report on everything. For those who are opposed to the topic or remain skeptical, but also for those who are doing their own research, I would like to give you another tip: between the Thuringian communities of Luisenthal and Crawinkel - not too far from the Ohrdruf military training area - lies the Kienberg. If you were to examine this mountain with the most modern scientific equipment available today, or better yet, carry out a satellite 3D scan, you could find what others and myself have been claiming for years: one of the research facilities that produced the material for the German nuclear weapon delivered. Not so long ago, a drilling team came across something that, according to the official interpretation, should not have existed at a depth of 30 meters: concrete. (The corresponding drilling report is available.) Why was the work not continued? No money, no desire, no backbone?

The Kienberg near Luisenthal

(Photo: Thomas Mehner)

From skeptics one only ever hears statements as to why something cannot have been this way or that way. When are these people going to get organized, raise money, and do massive research to definitively disprove what others and I are claiming? Of course, they won't do anything of the sort, because the risk of stumbling upon something unusual is far too great. It is also much more comfortable to act from the desk and to damn all who do the opposite and seek the truth. However, the "bean counters" have never been able to prevent new information, new insights and thus what is generally called progress. That gives hope that it will be the same this time - and the propaganda of the media will not change that, whose representatives anyway only show how resistant to facts and fearing the truth they are. «

*

It is strange that for most journalists, historians and physicists, German nuclear research only exists in the form that was circulated in numerous accounts after the war. The developments of the past 20 years have completely passed the ladies and gentlemen, and those who dared to break cover and other, much more successful structures (Reichspost, Großindustrie, SS/SD) in connection with the German nuclear weapons)research have shown are treated with ignorance and silence.

It turns out that even the sites that have always been associated with German nuclear weapons research

or to which there are cross-connections, such as the Thuringian city film, have hardly received the attention they deserve to date. Dr Kurt Diebner led two groups there, one of which only appeared at the end of the war, while the other had been there longer. What Diebner had evacuated before the Americans approached is probably not all (even if this is repeatedly claimed), so it is not surprising that years after the war, in the days of the GDR, certain rumors made the rounds that there nuclear weapons had been worked on underground until the end of the war.

As you can imagine, this topic was explosive, so that the Ministry for State Security of the GDR (MfS) had to deal with the problem, mainly in the form of the district office in Arnstadt. It is noteworthy that the research was not carried out with the vehemence that one would expect in view of such a problem, but that the process was completed after a relatively short time. The bundle of documents presented to us by the authority of the Federal Commissioner for the Records of the State Security Service of the former German Democratic Republic (BStU), also known as the Gauck, Birthler and Jahn authorities after the acting Federal Commissioner (source: BStU, MfS, BV Erfurt, AS, No. 2/68) and to which we refer below, is only a few pages long. These hardly do justice to the topic of the German atomic bomb and the research connected with it.

In a letter with the strange formulation »Research Center of the Reich Ministry Ilm (School)«, dated July 8, 1966, it says first (we limit the naming of names to people from contemporary history):

»For a few weeks, members of the press from Ilmenau have been investigating the crimes of Federal President Lübke, including in our district. In doing so, they came across fascist secret documents that speak of a former important research center for nuclear fission in Stadtilm. This research center was located below today's school in the backyard of the Ratskeller and on the property of the current Seeger lamp factory. In the basement of the school there is still a 13 meter deep well, which was used to store heavy water, which is needed for nuclear fission. During clearing work on the Seeger property, a number of lead plates the size of a brick and smaller were found, which were presumably used in the research work to protect against radiation. As a result, some members of the air protection service carried out Geiger counter checks on the property already mentioned. While the lead plates showed no radioactivity, a small percentage of radioactivity was detected in some places in the well.

It was also announced that the employee of the former research group, Dr. of physics Berkei, has been in the Bad Berka pulmonary sanatorium for a few weeks. A blood test from this person showed that he was showing signs of decomposition such as those seen in radiation sickness.

According to the assessment of the doctors there, however, this can no longer occur after 20 years. Because of this, there is a suspicion that the named person has recently been dealing with radioactive material had to do. The other employees of this for

research center are no longer on the territory of the GDR. For example, the person Geyer, who was head of the Laborglas Ilmenau company, which left the GDR illegally a few years ago.

So far, the following people have been identified who worked as unskilled workers in this research center: [●●], Erich Rundnagel, both living in Stadtilm, [...]. These people have not yet been spoken to.

[●●.]

Sergeant« *

The latter was interrogated on the same day (according to an interrogation record dated July 8, 1966) - but more on that later.

In addition, the MfS district administration Suhl, Department II/3-4, dated July 15, 1966, regarding a report on a meeting held with a GI (secret informant) the day before, between 5 p.m. and 7 p.m. in a district town of what was then the Suhl district had taken place. The document said:

»[.●●]

The GI reported as follows: 1.

About the suspicion of atomic bomb production in Stadtilm, District Arnstadt, in the years before 1945.

The [...] expressed the following:

There are underground passages and rooms on the school grounds in Stadtilm. Atomic bombs are said to have been manufactured there before 1945. As a cover [camouflage], the fascists announced or named the manufacture of shoe polish.

On July 5 or 6, 1966, he inspected the site and the corridors. The door to the underground rooms was fitted with a security lock and

locked. Days later (1 or 2 days) the door was found bricked up. The site is said to be partially owned by a Dr. Bergei [Berkei] or similar, who bought it shortly after 1945. Only this Dr. Bergei [Berkei] and his son have. This dr Bergei [Berkei] is said to have worked on this site before 1945. Today he owns a small business. the dr B. is said to have refused to work with us as a nuclear specialist. It is suspected that B. bought up this site on behalf of West German authorities so that he would watch over it and no access would be permitted.

It is also assumed that complete production rooms and possibly a laboratory are still available. [...] used a Geiger counter in the corridors, which also indicated.

The rocket specialist Wernher von Braun is said to have been in Stadtilm before 1945. The son of Dr. Bergei [Berkei] or similar is said to have overheard their conversations and is said to have informed his father. For a few days, the son of Dr. Bergei [Berkei] may have disappeared. [...] let it be known that the relevant state authorities were not yet aware of any of this.

He [...] himself wants to carry out investigations on this site [...].«*

That was the end of the two-page document. What we only noticed in a second analysis of the paper: In addition to point 1, there must have been **at least one other point. One can clearly see on the copy of the MfS log that there was a sequel, but this was covered, as was logically the text it contained.** However, the censor did not work carefully enough, because the top edge of the text of the sequel was copied.

The question of who took over this cover (whether MfS or BStU) could be clarified just in time before the book went to press (one of us made a corresponding request to the Stasi records authority). Our assumption that the MfS had intervened to censor was confirmed. Apparently there was a higher, overriding interest in not making known some of the information originally contained in this document, because if the GDR secret service agents had only partially understood what had been reported to them a few days earlier by the master plumber Erich Rundnagel - that The corresponding interrogation protocol from the MfS district office in Arnstadt is dated July 8, 1966 and will follow shortly - then it must have been clear to them that the process could not possibly be processed at the district

The transcript of the interview states:

»We had a discussion today with master plumber Erich Rundnagel, resident: Stadtilm, [...]

regarding the former research center for nuclear fission in Stadtilm by the undersigned and found out the following: Rundnagel was appointed Mayor Heberlein in July 1944. There he was entrusted with installation work within the research center by two members of the secret state police, sworn to silence and a few days later brought into contact with the senior staff of the research center.

The research center was headed by Prof. Dr. Diebner [Diebner was >only< Dr.]. The scientific staff included Dr. Reblein [Rehbein], Dr. Bergley [Berkei] and Ing. Rackwitz.

dr According to Mr. Rundnagel, Bergley [Berkei] was in Norway before his assignment in Stadtilm, where he is said to have worked on the extraction of heavy water. According to Mr. Rundnagel, Diebner and Reblein [Rehbein] are staying in WD [West Germany]. Berkley [Berkei] remained in what was then the Soviet occupation zone and is now the owner of the Seeger lamp factory in Stadtilm. Seeger is the father-in-law of Dr. Bergley [Berkei].

Bergley [Berkei] has been ill for a long time, was in the Bad Berka sanatorium and is now said to be in the Erfurt Medical Academy. As Mr. Rundnagel pointed out, Bergley [Berkei] suffers from an incurable liver disease.

In the further questioning of Mr. Rundnagel, he expressed that in his opinion developments were planned in this object that should deal with nuclear fission.

However, he claims that no research experiments were carried out in the research center until the collapse of fascism in 1945, since the laboratory was still under construction and he himself was busy with the installation work until the day before the Americans invaded.

At this point, the entire staff of the research center left Stadtilm for southern Germany and took with them on a truck all the valuable material that could have been used for research purposes and that was already stored in the research center.

Mr. Rundnagel also explained that he did not know the nature of this material, but that it was stored in different places in the two basement rooms, covered with stearin and paraffin.

through dr Rebein [Rehbein] learned that 65 TDM [65,000 Reichsmarks] were kept in one of the two large safes set up in the basement. He also wants to have talks with Dr. Rebein [Rehbein] learned that in the other safe there were two Atom

bombs that he suspects were later dropped on Hiroshima and Nagasaki.

In further questioning about the lead stones found on the site of the fire, Rundnagel expressed that where they were found, they were stacked in the room (former workshop) that was deposited at that time. This lead was to be used to weigh down the lid of a plant in which liquid air was to be produced. However, this system stood in the courtyard until it collapsed

in front of the research center, was never assembled and was therefore not used.

In the conversation about the well in the basement, which was filled in in 1945, Rundnagel expressed that it was dug and lined while he was working at the research center. According to his estimate, this well was about 5 meters deep and used to store a large amount of normal water for research purposes.

According to him, heavy water has never been stored in the research center. He also expressed that it is unlikely that heavy water could have been found in the well.

Finally, Mr. Rundnagel expressed that from conversations with Dr. Rebein [Rehbein] understood that he was in contact with the forces of July 20, 1944 (attack on Hitler). In a conversation shortly after July 20, 1944, Rebein [Rehbein] expressed that the war was lost for Germany and that the German side would no longer use the atomic bomb.

[...]

Captain BV

[...]

Sergeant« *

Apart from the fact that almost all names were misspelled in it - we corrected them

the correct spelling in square brackets is, in our opinion, an important piece of contemporary history

Document, especially since it shows that we are not the first to introduce the story of the existence of a German nuclear weapon to the discussions about the true status of German nuclear weapons arphysics occurred during the Second World War, but that there had been »rumors« and indications in this direction long before that, which, however, at least in the days of the GDR, were not necessarily publicly communicated.

The fact that the Diebner group member Dr. Friedrich Berkei ultimately stayed on site, although a specialist like him would certainly have had completely different opportunities for professional development in western Germany. Was he one of the Grail Keepers? In any case, his death is a mystery. In this context, the MfS claimed that he had succumbed to the effects of radiation sickness, which he had contracted during or after the war experiments in Stadtilm. Based on the research we carried out years ago

However, this claim most likely did not correspond to the facts: Dr. Rather, Berkei died at the

Consequences of a very rare protein metabolism disease, which can only be caused by an Aspergillus fungus, as it occurs under certain conditions in underground cavities (!).

We believe that dr. Berkei had an assignment - to stay on site in order to keep under control what was still in Stadtilmer soil. In our opinion, the strange clinical picture of his person indicates this, among other things. The fact that the eyewitness Rundnagel claimed that the commissioned laboratory was never completed is irrelevant in this context, because it worked

Yes, it was only about establishing the second Diebner working group in Stadtilm, while the first had long been active in the area. It was impossible to get their laboratory equipment to safety with a single truck operation...

In this context it should be pointed out that many years ago one of us was lucky enough to meet some old gentlemen from Stadtilm and its surroundings who had noticed a lot at the end of the war. During the evening conversation, which lasted several hours, time showed that the middle school behind the Stadtilm town hall and its basement rooms were only the tip of the iceberg; there are numerous other areas in the immediate and more distant surroundings, which are interspersed with underground facilities and from which it was not known after the war what research and production was taking place in them.

During this conversation, Mr. Mehner found out some names of people and companies that have not yet appeared in contemporary reports in connection with the Stadtilm location. There will be a more detailed report on this in due course.

But now to the all-important question: Is it conceivable that two atomic bombs were stored in Stadtilm? Before we give an answer to that, let's first let the author Günter Nagel speak, who in a detailed book entitled *The Secret German Uranium Project 1939 -1945. booty of the Allies* in its own way. On page 258 Nagel, who tries to distance himself from »dubious« authors and their descriptions, writes:

* Heinrich-Jung-Verlagsgesellschaft mbH, 1st edition, Zella-Mehlis 2016.

"'Two atomic bombs in a safe' - that is, of course, nonsense from A to Z. At best, it could have been parts for some kind of experimental model, or small amounts of fissile material, or a detonator mechanism."

We do not know where Mr. Nagel gets his wisdom from, but the fact is that the *Los Angeles Times* of July 20, 1945, on page 5, mentions Commander Herbert Agar, who served as "Special Assistant" to the US Ambassador in London and had given a lecture to students and professors at the elite Clifton College in Bristol, in which he mentioned that, according to Allied experts, Germany had used nuclear energy for the war in the (late) summer of 1945.

The report is an important historical document in that it also reports on a wing commander AG Pither, who belonged to the Royal Australian Air Force (RAAF) and had more precise data: According to his statements, the Germans would have longer in the event of one During the war, from August 1945, "21-pound uranium disintegration bombs" were used, which would have been mounted on V-2 rockets, among other things. Downright amazing

on this statement is that 21 pounds sterling is approximately 9.5 (metric) kilograms. The German »disintegration bombs« were obviously smaller warheads (the existence of which we have always postulated). But that's not all: Remarkably, the 9.5 kilograms roughly correspond to the weight of the nuclear weapons in Stadtilm, which are said to have weighed around 8 kilograms. (We had reported on this in earlier books and therefore refrain from further information at this point.)

Which establishment historians still don't understand to this day the have is that developed in the German Reich
Second-generation nuclear weapons have already reached the stage of had undergone miniaturization. While the first generation was still large and heavy, the second was much smaller and lighter. And if the V-2 was intended to carry a nuclear weapon, with a payload capacity of about a ton it could hardly carry a 4.6-ton Fat Man bomb. Logical, right?

Of course, one can argue about the definition of what a bomb is. In general, it is a weapon that causes an explosion. To put it more precisely, a bomb is an explosive device filled with explosive material that can be detonated by a detonator to cause destruction or kill people (according to *Wikipedia*).

Things are a bit different with a nuclear weapon: the actual bomb is the central core, i.e. the Pu-239, U-233 or U-235 charge, and the detonator (without leads, etc.). The core was transported by »The Core«, also called »Box«. Since it is well known that a picture says more than a thousand words, we want to use a historical photo to show how big the "box" was in the "Trinity" test plutonium bomb that was detonated on July 16, 1945 in the US state of New Mexico and which allegedly came from US production (or the production line of German nuclear weapons of the first generation).

»The Core« was easily transported by a single person, as the photo on the opposite page shows. If the central part of the large first generation plutonium bomb (the "Trinity" and "Fat Man" plutonium bombs were identical in principle) was already so small and, according to the website *Rare*

Historical Photos weighed just 6.2 kilograms, the "box" with the detonator could very likely be in be housed in a man-pants steel cupboard.

* then

* See online: <https://rarehistoricalphotos.com/harold-ag-new-carrying-plutonium-core-nagasaki-fat-man-bomb-1945/> (accessed April 27, 2019). The website also features a photo of ~~the~~ ^{the} plutonium "box."

Now, however, we must not forget that it is related to the two Stadtilm nuclear weapons were not about a first-generation bomb, but about one that was obviously smaller in size and is said to have weighed around 8 kilograms. Impossible? We would like to eliminate this word from our vocabulary in relation to what German scientists and engineers were able to achieve during the Second World War. As we have just established, even the central part of the "Fat Man" Pu-239 bomb is not so large that it cannot be fitted in a large steel cabinet. But what about the smaller nuclear weapons, which were also developed in the United States in the 1990s and then transferred to military service at the beginning of the 1990s, such as the "Davy Crockett"?

Certainly, it is a nuclear weapon of the lowest performance category for tactical battlefield use with a detonation strength of only 10 - 20 tons of TNT equivalent.

* But still: it is proof that nuclear weapons could be built very small decades ago, since the entire warhead weighs only 16 kilograms. In addition, we are of the opinion that the Americans have mastered the fine art of building nuclear weapons

tion has never been known, only the Germans controlled them!

So if the author Günter Nagel had a acid test in Regarding what he said about the possible presence of two Nuclear weapons in a steel cabinet in Stadtilm, that is: the actual ones, absolutely

*

At the beginning of our research 20 years ago, we still had to laboriously determine such information, today it is even available on *Wikipedia*: [https://en.wikipedia.org/wiki/Davy_Crockett_\(nuclear_device\)](https://en.wikipedia.org/wiki/Davy_Crockett_(nuclear_device)) (accessed on May 7, 2019).

**The American »Davy Crockett«. Question: Does it fit?
nuclear warhead, seen on the right, docked to a rocket
propellant in a steel cabinet?**

(Public Domain, Wikimedia Commons)

researched accessible facts, the result should have been different. You can very well have two nuclear weapons (even including the bomb casings!) in steel cabinets - mind you, operational systems and not just any test bodies or their individual parts!!!

In this context, we regret to say that German historians, for some reason we don't understand, seem to have enormous problems with the remote possibility that the nuclear experts of the German Reich could have won the race for functioning nuclear weapons. As soon

anyone who claims such a thing, and if that person is not part of the illustrious guild of modern court reporters, will be labeled "frivolous," while the know-it-alls and know-it-alls continue to believe that victorious history is the only true and relevant thing.

Somehow, historians have failed to grasp that German engineers and scientists were at the forefront of numerous new developments in weapon systems during World War II (missiles, aerial bombs, jet aircraft, anti-radar coatings and so on) while the Americans were the ones doing it are said to be able to successfully develop a nuclear weapon. A stair joke of world history.

Maybe that's why the established ones are something dull because they don't know that German scientists from 1943 penetrated into completely different areas of physics. During the first tests of nuclear fission bombs, it was noticed that although their effect was catastrophic, they were not weapons that could bring about the »Twilight of the Gods« that Hitler later proclaimed. For this reason, research continued, and the result was on the one hand fusion weapons, which were not only more efficient but also achieved a higher detonation power, and on the other hand, ultimate weapon systems based on other physical principles, such as the RADgUM we already mentioned. A sufficiently large amount of it is able to destroy entire nations, even continents - and as a last resort even tear the planet to pieces. What do historians know about it? Nothing!

Just as little do they know about the fact that German Scientists found ways to manipulate gravity and find a solution to the energy problem.

feed. (If one then has to experience today how the »energy transition« practiced in the Federal Republic is being carried out, then it only remains to state that experts were at work back then, while one should not say a word about those active today. A real energy transition is what is happening in this country is presented, at least not.)

As long as the ladies and gentlemen experts appear so uninformed, we shouldn't be surprised if they - figuratively speaking - talk about "apples" while we talk about "pears". As we see the light at the end of the tunnel

seen or were allowed to see more than 10 years ago, our critics didn't even get to the tunnel entrance. How do you want to talk profitably about the whole topic with such uninformed people? We don't do that because it's pointless. Certainly, one may accuse us of arrogance.

But this is still better than the ignorance observed among our critics and the "experts".

But back to Stadtilm: One should be aware that some of the scientists from the Diebner group who stayed there must be seen in terms of their importance in a completely different way than was previously the case. According to the current state of knowledge, one person deserves our very special attention: Prof. Dr. Karl Wirtz (1910-1994).

The previous biographies show him in general as a reactor specialist, but due to a lack of knowledge they withhold the important information that in 1941 he was a (secret)

Registered a patent with the Reich Patent Office, which only came to light through the German journalist Gaby Weber, who lives in South America, in connection with her research into the actual origin of the Israeli nuclear program

* [https://de.wikipedia.org/wiki/Karl_Wirtz_\(physicist\)](https://de.wikipedia.org/wiki/Karl_Wirtz_(physicist)) fen on
April 26, 2019).

(absolutely

could be promoted. The whole thing did not work without the help of a lawyer, because Ms. Weber had asked the German Patent Office about this years earlier, but received a negative answer. (It was no different for us years ago, but we were still able to find a number of patents which, when West German science was allowed to work again in the nuclear research sector, had been [re-]registered by former Reich German nuclear specialists and gave a status quo ver-

* Gaby Weber's film documentation on the subject »Israel's atomic bomb - crawled out of the Nazi bosom?« is available online at <https://www.youtube.com/watch?v=rJCIsenkrGA> (accessed May 2, 2019). It not only shows that with regard to the German nuclear program during the Second World War, many representations must be massively questioned due to their incompleteness and the resulting misjudgments (to put it politely; we could also tell of the spread of lies speak), but also that the German nuclear experts at the time wanted the atomic bomb and that the assertion that they did not want to give Hitler such a weapon is untrue. It is also shown that there were at least two different nuclear research levels, with the one with the lower priority not being allowed to know anything about the one with the higher one. It is also documented that US and probably also German authorities filter knowledge about the status of German nuclear research up to 1945, i.e. limit it to a level that corresponds to previous historiography. But that is not all: After the war, the German nuclear scientists and their knowledge were used to secretly and quietly enable the Israeli state to build a nuclear arsenal, with the Federal Republic of Germany supporting the project with (at the time) enormous amounts of money. Weber's documentation proves that the true story of German nuclear research during the National Socialist era and in the decades that followed has *not* been reported to date, but that German and world public opinion - and this formulation is the only correct one - has reported on it was lied to by all the rules of art.

advice that these experts could only have acquired during the war.)

One may wonder: Years ago, Dr. Rainer

Karlsch identified the patent filed by Carl Friedrich von Weizsäcker in 1941 for the construction of a plutonium bomb, and now Gaby Weber identified the patent of the Wirtzsche reactor application, which dates from the same year. If you still don't notice what's being played, you can't be helped: By withholding the basic information on German nuclear research, for example in the form of important patent applications, the Allies later made it difficult for workers to deal with the subject at the time assess the situation correctly. For example, had historians working decades ago known about these patents and consulted physics experts, the latter would certainly have suggested that further investigation was worthwhile (and the claims of Allied historians should be treated with due caution) .

This further research would then have been very likely

showed that the Germans were much more advanced in terms of nuclear (weapons) research than the two winners of World War II claimed...

But that is exactly what the Allies wanted to prevent. Whereby we take the view that if they resorted to censorship and secrecy on the basic documents, then obviously there must be other things so explosive that they had to be withheld.

There may have been another reason for the cover-up and secrecy mania.

Just imagine that the Americans used German booty bombs or, to put it more generally

used captured German technology that successfully ended the Pacific War and wiped out the two Japanese cities of Hiroshima and Nagasaki, killing hundreds of thousands of civilians if you count the long-term effects. Imagine

They further state that they had no scruples about using those weapon systems that were controlled by the SS, which in turn was responsible for the deaths of thousands who, under conditions that are scarcely imaginable today, had to create cavities underground for the secret development and production facilities and /or were used in weapons development and production and who, as accomplices in the secret projects, were ultimately blasted into the underground facilities at the end of the war or otherwise killed. If one thinks about this speculative scenario presented here, one can at least begin to understand why the Allies would not for anything in the world - assuming that we had correctly grasped the situation - admit what really happened during the phase of the end of the war and in the After that, everyone who benefited from German technological developments would have to put up with the accusation that the blood of those who died is also on their hands.

Admittedly, the Allies had no problem at all with using the captured V-2 as the basis for their own later missile technology and with having the German scientists and engineers involved work in their service, even though they knew full well that, for example, thousands of prisoners were used in the underground production of the V-2 system in Mittelbau-Dora (near Nordhausen, Thuringia), many of whom died. However possibly that's what pertaining to

the results of German nuclear (weapons) research has reached a dimension that is no longer imaginable for people with decency and morals.

That there must be something to this assumption of ours - to put it bluntly - is shown in our opinion by the sometimes overly long confidentiality periods of up to 100 years, which, to use a current example, only differ from the 120-year classification certain documents for the protection of the constitution on the subject of the »National Socialist Underground (NSU)« are surpassed. In both cases, in our humble opinion, there must be an Augean stable of unimagined proportions behind it!

There is no question that the information collected by the MfS on the subject of »Stadttilm« was of a special kind. We also assume that those responsible in the GDR secret service were also aware of this. Because would have

one - and this point of view has to be discussed here because it has been completely overlooked up to now - the one mentioned by master plumber Erich Rundnagel

Connection of the former existence of two atomic bombs and the subsequent US dropping of such weapons over Hiroshima and Nagasaki, this would have been an enormous propaganda success: The

GDR government would have the class enemy USA except for the Bones could have been embarrassed if she had presented evidence showing that those in charge of the United States of America, who liked to pose as moralizers, had looted nuclear bombs "of fascist German origin."

Production« - to use the GDR style - to two

Japanese cities had dropped.

Show the accessible documents on the »Stadttilm« case that the MfS is taking care of the issue

but left us with the impression that too little was being done at the county or district level to follow up the information that had been obtained through surveys and that had been provided by the Secret Informer (GI). However, the case may have been handled "from a higher place," which the tampering with one of the logs that we show on page 161 could indicate.

On August 27, 1968, the MfS district administration in Suhl sent a series of photos to the MfS district office in Arnstadt. (We present these on pages 180-188.) The letter in question states:

"We're sending you 12 photos that an IM [Unofficial Associate] of our department took on behalf of a newspaper reporter.

Photos 1-3 show former wall openings that the owner had walled up after the newspaper reporter's first visit (except for 3).

Pictures 4 and 5 show what appear to be bricked-up openings in the basement floor, and Pictures 6-8 show facilities whose meaning and function the IM was unable to interpret. [...]

captain"

This final report surprises us insofar as the Ministry for State Security of the GDR showed significantly more activities in far less important or unproblematic cases. Particularly strange is the fact that the walls mentioned by GI were not checked or opened, especially when ionizing radiation occurred (and this was measured) in general with the greening

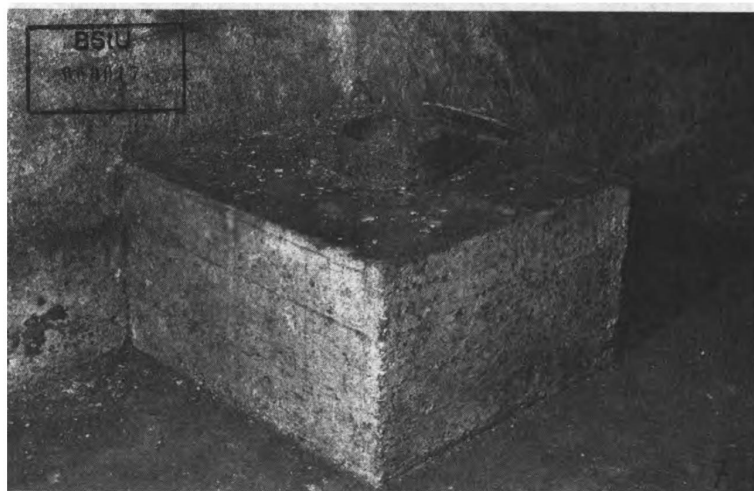

The building of the former middle school in Stadtilm (photo 1), in its basement (photos 2-12) the thief's nuclear research laboratory
ner group should be accommodated. (Source for all photos: BStU,
MfS, BV Erfurt, AS, No. 2/68).

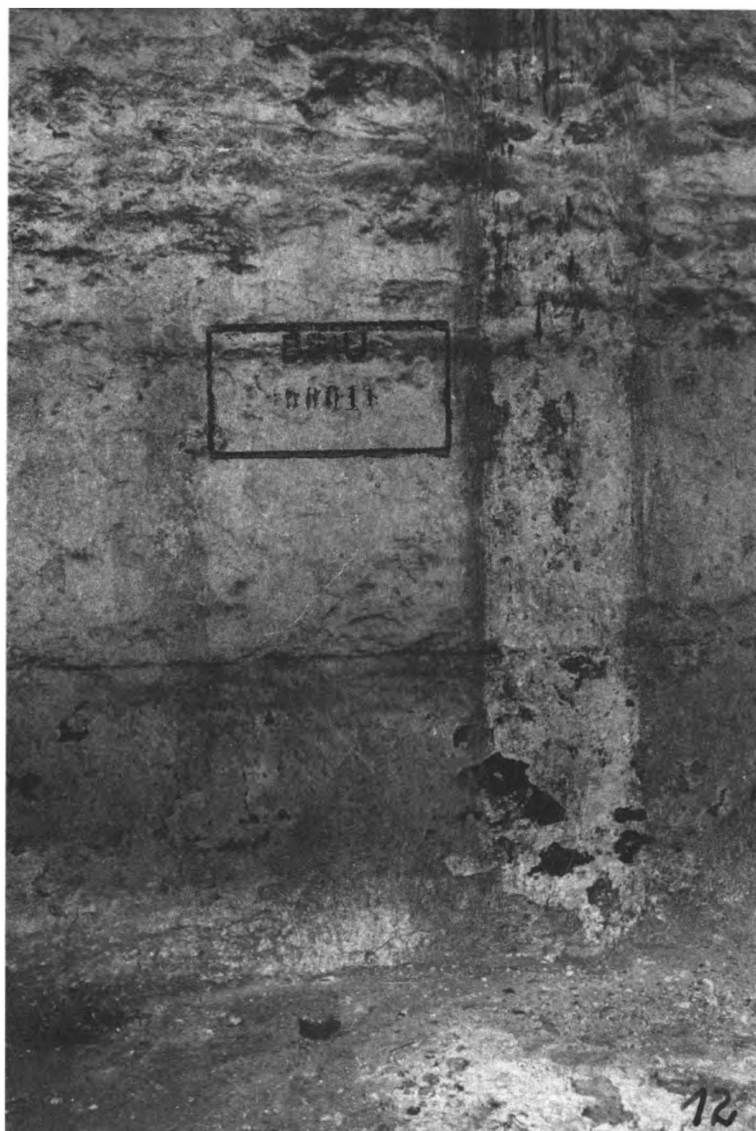

düng »Imminent danger« could have been acted upon, also with the involvement of other official structures.

Since we do not know which higher-level departments were involved in this case, or whether the Russians, who certainly had something to report, were asked about this matter, it is difficult to make a conclusive assessment.

We are currently assuming that the actual "city film secret" has not yet been elucidated and that for this reason this Thuringian city and its surroundings will not only be of interest for our considerations in the future, but that at some point - we will see that in any case - can lead to problems of a special kind. On a map that was created as a result of Russian reconnaissance activities and that is available to us, not only Stadtilm is marked (among other things with the note "nuclear laboratory" in Cyrillic letters), but the Russians also have Griesheim, to the south-west of it, where some German nuclear researchers were housed, marked net. South or slightly southwest of Griesheim is Cottendorf, whose southwestern to southeastern surroundings have also been marked several times (partly with specific comments, partly in the form of suspected areas shown hatched). Two markings are particularly conspicuous here, one depicting a skull and crossbones underneath, and the other a symbol that means »radiation«. Such a symbol is also noted halfway between Stadtilm and Griesheim - southeast of Niederwillingen.

Unfortunately, the map does not show whether the Russians attacked the suspicious and dangerous areas or whether they left them untouched and merely made a note.

In any case, the registration density is high.

"Great minds have always found fierce opposition in the mediocre. The latter cannot understand when a man does not mindlessly submit to inherited prejudices, but honestly and courageously uses his intelligence and fulfills the duty of speaking clearly the results of his thought."

Albert Einstein

The creaking in the beams of CAPITALIST SYSTEM AND THE SOLUTION TO THE ENERGY PROBLEM

In a book like this one, which mainly deals with the question of the true state of German high technology, and here especially the atomic bomb, during the time of the Second World War, allow us to also go into today's human social system of predatory capitalism, which is contrary to natural laws. that has no solutions for the problems of (ordinary) people. If we want to comment on this in a more or less philosophical way at this point, there is a reason for this, which will become clear to the reader towards the end of the chapter.

In the Federal Republic of Germany in particular, it seems that the point has now been reached where the contradictions within the system are increasing to such an extent that it is feared that a Gordian knot will form, which in future can only be untied with a sharp sword.

On the one hand, the German leadership pays homage to climate change and wants to demonstrate its pioneering role to the rest of the world (approximately 97-98 percent in relation to global man-made carbon dioxide emissions) through an energy turnaround it is driving rising energy prices unfortunately - and that's not only the case for the average consumer, but also for numerous medium-sized industrial and service companies.

If you think this development through, the Germans will perhaps one fine day have saved their country's microclimate, but they will wander through the forests again with bow and arrow to secure their lives, because energy from the socket has become unaffordable and with it the blessings civilization can no longer be used.

The political decision-makers not only have the problem that they themselves suffer from the greatest shortage of skilled workers that this country has ever seen, but that they obviously do not understand the simplest connections, which say, for example, that a highly developed civilization uses energy needs that is *cheap* .

So here are a few thoughts about ours system and the energy issue.

*

All theory is gray - as practitioners know. And some

Change comes faster than expected - not only revolutionaries know that. In the past ten years, a development began that changed the previously familiar (carefree) life of the inhabitants of the western world will still be thrown upside down. There is already an audible creaking in the beams of the (capitalist) system, not only because claim and truth diverge more and more, but because a threat is looming that is not new, but was recognized too late on this scale. No, we don't mean the (now recurring) financial crisis, the migration catastrophe or the supposed climate change, all of which are just the overture of completely different phenomena.

It's about overpopulation and the fatal, almost delusional desire of certain ideologues to enable everyone to live a life like that of the modern westerner

equals, for which - which is completely overlooked - we need at least two more planets of the Earth type.

At no time have we been able to understand (better: comprehend) that in a world whose resources are finite, those responsible for economics and politics adhere to a *completely insane* idea - namely that of constant growth. The protagonists believe that continued growth is necessary (actually only blasting the horn of the insatiable high finance structures and their

blowing exploitation methods over interest) are the best examples when it comes to showing how far man has strayed from nature. But don't worry: The men and women will be historically more manageable

time to bring them down to earth, perhaps faster and harder than they ever thought possible.

One of the main bases of growth in the western world is the consumption of (cheap) energy. Power plants produce electricity by burning coal, gas, oil or by nuclear reactions; Crude oil and coal are also used as raw materials for the chemical industry and as fuel

processed. It doesn't matter whether those who claim that the oil production peak (the so-called »Oil Peak«) is right are already reached or exceeded and we all prepare for it

have to face having to pay for the ever-scarcer oil more and more expensively, or whether those who think that there is still enough oil that is no longer so easy to tap are right - the fact is that the black juice of capitalist life is the problem because it threatens to reduce its flow rate. You have the problem everywhere

recognized, but all currently possible alternatives -

Wind power, biopower, solar power, nuclear power - are not large and comprehensive in percentage terms in many states

expanded enough to completely replace oil as an energy source. Those responsible in the oil industry know this too.

Years ago, representatives of the European energy authority even said that the oil companies had deliberately outmaneuvered them - that is, they didn't let them know how bad the oil problems were. Well, it's your own fault: you can't believe the fox when he reports that all the chickens are still in the coop...

Certainly there is no point in panicking. But the world population's thirst for energy bodes ill. Western Europeans and Americans want to maintain their standard of living, nobody is willing to give up anything voluntarily. On the contrary: the US invasion of Iraq years ago showed very clearly that the (still) leading world power on this planet was moving regardless of

access to the vital resource of oil in the event of losses. And that's not all: the next target is Iran, which - fortunately for Western political propaganda (there can be no question of balanced information) - is definitely, possibly or not at all working on a nuclear weapon, which Mr. Trump and Mrs. Merkel as well as is a thorn in the side of all the others who belong to them. Strictly speaking, it's not about the bomb at all, but about the oil in Iran. If the USA had direct access to this black gold, the seriously ill patient (the Western economy based on oil) could be kept alive a little longer by means of express fusion. But a Middle East nation that, because of its sovereignty, claims the right to catch up with the West in military and technological terms is a problem for the United States and its allies: a quasi-second-class state that used to be kept in certain neo-colonial dependencies could not put up with everything. It

It is logical that such efforts must be stopped and that the sanction method is now being used to force him to give in.

However, the fact is that not only the USA and Western Europe have developed a pronounced hunger for energy, but that China and India are also on the way to following the West. What has been experienced in China in particular in the past 20 years is outrageous: During this time, many people have gone through a development from rice paddy farmers to residents of a high-tech city who can no longer live without their smartphones. The whole thing is then referred to as progress, although strictly speaking it is the complete opposite. The Chinese city dweller is little more than a human ant - locked in a 40 square meter apartment and monitored by his government with every trick in the book. And, of course, it now uses a lot more energy to sustain its existence than it did 20 years ago.

Another problem: all science and technology use little or nothing if you are not able to analyze the problems at hand and look for ways out that represent a *long-term* solution. In addition: Doing this now is very likely too late.

Decades ago, we should have started to place the world's energy security on several solid pillars - especially on those that can be described as really progressive. Of course, oil, coal and gas are gifts because they are so "easy" to extract and process. But they carry a curse that will come to fruition at some point, since the production volumes may stagnate in the future, perhaps even decline, and these energy sources are used in a silly manner - that is, speculation on a large scale.

In Germany, people may currently think that the energy transition that has been initiated would be the salvation, but they fail to realize that switching off all conventional energy suppliers will be a very difficult undertaking and that the so-called "alternative technology" in the form of solar systems and wind turbines will not be the definitive one solution can be. Strictly speaking, this is a technique that should only be used as a *support* ; other processes have to cover the large energy requirement, but these are not available due to a lack of research.

It will be interesting to see what Europe and the USA will be able to endure when they have to face the Chinese and Indians' growing thirst for energy in the future. The system is likely to be shaken.

In the past 30 years, the unheard of has already happened: Just look at the price increases for electricity, gas, petrol, diesel, heating oil and the like. The money that the average consumer has to spend to maintain his bare existence is not available for consumption. When will this effect hit the economy?

Of course, people still pretend that it's not all that bad, as long as exports are booming in Germany, for example, which was the case in the past ten fat years. But even that can go wrong at some point: Germany supplies equipment, technologies, machines and vehicles for those nations and economic areas that finally want a piece of the (world) cake. Entrepreneurs in this country are happy about that, but they forget that those who are blessed with the blessings of modern civilization will soon only know electricity from the socket and will want petrol or diesel for their car. Madness not only has method,

but now it really picks up speed and - like an exponential function curve - goes over to a steep rise. A »ascension into nothingness« begins, but with drums and trumpets.

And anyone who believes that the Chinese scam of relying on electromobility is a solution is also wrong. Many rare substances are required for battery production, which at some point - if they want or need them all - can also become a reason for military conflicts, like oil is.

Ultimately, the all-important and fundamental question arises as to whether the Blue Planet can even support a population of eight, nine or ten billion people, whose individuals all want to live like the average German? We don't think. Even now, the situation is not under control: Thousands of children are starving to death every day, and the hunger riots that were recorded years ago - long forgotten, but nevertheless occurred and arose from the criminal use of grain for fuel production - signaled that that something has started that will end badly. Cynics now believe that the only solution to the problems of this "civilization" is the red button.

And indeed: Growing energy demand, rising Population figures, dwindling energy and raw material resources, aspiring great eastern nations that together do not represent 100 million people, but almost 2000 million!, a better life for all inhabitants of this planet - how should this go together?

Of course, until now people have always found some solution. However, it is forgotten that problems used to be more of a regional nature. The 20th century was characterized by continental problems

ted. And now a global disaster is brewing that will end in one big bang (or many small ones).

One has to be aware of the fact that the problems we have today are a direct result of globalization. Of course, her protagonists try to cover it up by claiming that (now that everything is too late) only a global approach to these problems can lead to a solution. Admittedly, the pyromaniacs waited so long to put out the fire that the whole house is now on fire and can only be extinguished by a large-scale fire brigade operation (although no one knows whether there is enough water to extinguish the fire). All those who pointed out decades (decades) ago that there was a small smoldering fire in this or that room of the house were bravely ignored.

What we mean to say is this: When problems were small, they were ignored; Now that they have multiplied, those responsible are calling for a large, global solution, which will ultimately be very painful for everyone involved and, in our opinion, in will end up in an eco-gulag with total surveillance. We also think that the bankstem and political gangsters are not concerned with saving the environment and humanity, but with a new business model that can generate billions, maybe even trillions, every year for decades. Of course, you have to know that the system here is not a democracy, but a flawless plutocracy with a tendency towards kleptocracy that is becoming increasingly evident. The citizen is no more than a lemon to be squeezed.

The most important topic of all, which we have repeatedly discussed, is that of cheap energy with all its facets. In contrast to the Greens, who make energy more expensive

we believe that a highly developed civilisation, which mankind claims to be, can only master all of its tasks and challenges if it has an abundance of extremely cheap energy, which is also produced in a way that is compatible with nature must. When we then have to hear and read that there is talk of »saving energy« in the federal German sphere of influence, then we ask ourselves whether the inmates of the mental asylum are allowed free access.

It's no secret that people around the world fell asleep trying to solve the energy problem. The talk about alternative or renewable energies that has been heard for years is of no use. For two decades we have been watching closely what is being done in general desperation to belittle the energy crisis itself. It worked for a while, but not anymore. The price spiral turns that one gets dizzy. And it will be interesting to see what will happen when (in this country) the carbon dioxide tax is priced in first. Interestingly, there are contemporaries who can even see something positive in this development, along the lines of the motto: the rising oil and gas prices will save the global climate! Of course, that's only true if you're willing to believe in the current climate catastrophe scenario.

And while nobody knows where and when all this madness will end, according to information from our representatives, the average consumer should content himself with what he earns. Well, the ridiculous increases in wages and/or salaries of two, three or even five percent are not worth mentioning anyway, because they are not even able to cap the galloping inflation.

Not to mention the fact that five percent gross more sometimes means seven percent net less

ten. German tax law makes it possible - keyword: cold progression! When will our ladies and gentlemen politicians worry about what depresses, frightens and upsets the people?!

The latter problems are, of course, only the minor difficulties that are not of interest to those responsible in this country. The difficulties on a large scale shouldn't be overlooked: As it turns out, upgrades have been going on for ten years as much as they can. Possibly also because everyone notices that »something« is no longer right.

(This something is the energy and raw material hunger of the developed as well as emerging nations.) If you believe the published figures, over 1 trillion dollars were spent on armaments in 2007, in 2018 it was already 1.8 trillion! Everyone is afraid of everyone, everyone threatens everyone with violence. Iran wants to wipe Israel off the map, Israel wants to launch a nuclear attack on Iran, and Hillary Clinton, who once ran unsuccessfully against Donald Trump, even wanted to "wipe out" Iran completely.

After the experiences of Hiroshima and Nagasaki and the happily overcome phase of the Cold War between East and West, to what low moral level does one have to have sunk to threaten an opponent with complete "annihilation"? We believe that those who make such threats publicly should be brought before a tribunal and tried without distinction of person. Resist the beginnings! Instead, the intellectual arsonists (here the term finally applies!) are given free rein. The end is in sight. But since it comes a little faster with it, you are now also upgrading in near-Earth space. Luckily there can be no question of a "Star Wars" yet, because the flying, airtight tin cans with which one is in

dare to orbit the earth are not yet a danger to alien star and planetary systems, but primarily pose a risk to those who sit in them. (Just remember the US space shuttles, which regularly lost their heat protection tiles!) Even these problems will be overcome, however, because when it comes to devising ever newer, more perverse methods of mutual destruction, human imagination and there are no limits to the spirit of research.

What we want to say is that if only ten percent of the technical-scientific capacities that go into armaments had been invested in solving the pending energy problem, mankind today could probably live in an energetic paradise. But that is not wanted. This world is ruled by fear and increasing dependencies. And the whole thing is called progress. Hallelujah!

The belief in progress, which is arguably delusional within this system, will cause the system to eliminate itself - just as a cancer destroys the body in which it spreads. Ever more highly organized matter will eventually extinguish itself - which some smart-ass people in Silicon Valley will try to prevent in the future by allowing people to fuse with machines to form so-called cyborgs. These lunatics then call it transhumanism. We can confidently do without such a future.

In view of the frightening development of mankind that has been observed for decades, it is no wonder that there were people who warned about it some time ago (but, as one can imagine, were not heard). Oscar Kiss Maerth is such a (long forgotten) example. The fact that we mention him here and also let him have his say is due to him

NEN simple reason: In our opinion, he is one of the few people who, through their own development, came to fundamental insights and articulated them without regard to existing conventions. Oscar Kiss Maerth had seen through the human (social) system to the bottom. In 1971 he wrote in his book *The beginning was the end* (Econ-Verlag) on page 240:

"The originator of this unsustainable system is an unworldly and deranged power: the United States of America. The 200 million inhabitants of this country make up less than six percent of the world's population, and yet they own about 50 percent of all essential material goods on earth on every continent, which they have seized by cunning, blackmail and violence. [...]"

The world's largest continent is Asia, home to two-thirds of the world's population. The western peninsula of this continent, which calls itself Europe and imagines itself to be a continent, had the courage to turn its back on the tenfold larger population in the east of the continent, to place itself in the service of the greatest marauding power of all time and its men to take over the anti-shen economic system.

This alliance is a betrayal of humanity..."

True words. Oscar Kiss Maerth had to face the accusation put up with being a pseudo-scientist because he dared to analyze man and his Western-dominated society for what both are: aberrant evolutionary history. You don't do that. After all, today's science believes in progress and, like a religion, thinks it can solve all problems. fact

but is that it is incapable of self-reflection and has no answers to the essential questions affecting the survival of mankind.

Oscar Kiss Maerth further wrote:

“Every single human being, whatever race or society he belongs to, must radically transform himself by only fulfilling his genuine material needs

satisfied, only works for them and switches to a simple, healthy lifestyle that is as close to nature as possible; this applies primarily to the people of the West.

People will realize that they are not making any sacrifices, on the contrary: they free themselves from all the false needs that have been imposed on them, for which they have worked pointlessly and made their lives unnecessarily difficult. «

These sentences went unheard - and the exact opposite happened: In the meantime, even the so-called emerging countries such as China, India and Brazil are on the fatal and wrong path of emulating the West. There is a method to madness! So the end will be even faster to come than Oscar Kiss Maerth (and others) could foresee. The exploitation of raw materials is increasing, the hunger for energy is growing. Wars are (are) being fought for all that's left. And nobody will be able to enforce that people who live in a city of twelve million (such as London) find their way back to a lifestyle that conforms to nature. This is pure illusion! So: on to the last stand!

A few decades ago there was really only one solution, at least according to what we have presented here

author, which could have saved us from total destruction, but which is no longer practicable for most people of the present because all chances for a return have been wasted. Oscar Kiss Maerth on page 239 of his book:

"The new world that offers humanity's only chance for survival can only be built on the rubble of the present unphilosophical, materialistic and criminal plundering western civilization, which can only be sustained through further self-enslavement and intensified destruction of the planet. It must therefore be demolished down to the foundation walls.«

If you think deeply about this quote, you have to agree with the author: We live in a slave system that will ultimately strangle itself, the head is already in the noose. This slave system also includes the so-called Greens, who, to stay with the image, are slave drivers of a very special kind, as they want to tighten the chains even more. They don't have any real ones either

Solutions ready, rather they are part of the problem. If it were otherwise, they would not support the madness of windmills, for example, which not only kills numerous birds, but also billions of flying insects.

A current example from our direct environment proves that one has to speak of wind turbine madness. According to a report in the South Thuringian regional *newspaper Freies Wort* from May 11, 2019 (page 7) entitled "City takes up the fight against windmills" is in the South Thuringian area between the so-called "Lange Bahn" and the village

Oberstadt plans to install up to 14 wind turbines, with 250-meter giants being discussed!

On the website of the Thuringian CDU state parliament
In addition, Kristin Floßmann was to be read:

»The fact that the red-red-green state government has set itself the goal of making one percent of the area of the Free State of Thuringia available for wind power is nothing new. [...]

If you look at the plan sketch for the district of Hild

burghausen, one [...] area immediately catches the eye.

It is designated W-6 Oberstadt and [encompasses] a size [of] 414 hectares in the middle of the >small

Thuringian Forest< as a unique natural and habitat for a
*species-rich flora and fauna.«

It turns out again and again that the green-painted ones are nothing but hypocrites (not to mention the red ones). Those who vote for these people are in no way saving the environment, but rather ensuring that it is destroyed much more quickly. If you know that a 250 meter high wind turbine, which is a primitive technology by the way, needs to be anchored up to 30 meters deep in the ground in the form of a concrete foundation, then such a system can hardly be described as environmentally friendly.

The following is interesting: After the Allies made it through their carpet bombing in World War II

* <https://www.kristin-fl0ssmann.de/aktuelles/2019/windkraft>. In this context, see also https://www.insuedthueringen.de/re_gion/thueringen/thuefwithuedeu/Regionalplan-Suedwestthueringen_Rotieren-um-die-Windkraft;art83467,6701977 (both sources retrieved on May 14, 2019).

had to destroy in numerous cases the German urban and building structure that had grown over the centuries, all too often buildings were erected after the war in the reconstruction phase that appear cold and soulless. If you take a look at what was put there and how it was executed, you have to ask yourself why architects, civil engineers and urban planners working in this country need a degree at all if they have only been able to do »steel, glass, concrete« for decades. Well, that's another way to destroy the soul of a people.

And as if all that wasn't bad enough, the German natural landscape is now also being destroyed by putting wind turbines in the forests. The whole is clear

Signs that the so-called energy transition is a completely ill-considered and stupid undertaking from the start. Intelligence expresses itself differently.

Let's be honest: We've now given up all hope for humanity and agree with Oscar Kiss Mearth that the moment the ape climbed down from the tree and began its evolution into man, its end was already programmed .

In fact, we're both happy to be of an age that allows us to write about these things and the whole (satanic) system that we're undoubtedly dealing with because it's anti-creative in every way, to wish the hell - where it came from. Let's just hope that we are spared the "blessings" of the future associated with digitization, artificial intelligence, transhumanism, and other insane manifestations of human incapacitation. Nobody needs these developments. They do, however, need slaves. And happy slaves obviously especially so.

Now let's report something positive

the motto: What should a solution to the earthly-human problems have looked like? (You can consider what follows as unachievable science fiction, if you wish.)

Well, first of all, human growth should have been limited decades ago when it was realized that the number of minds was increasing like an uncontrolled chain reaction. We all know where this leads: With an atomic bomb, an uncontrolled chain reaction leads

tion to destroy the entire system and release enormous amounts of energy within a very short time, destroying everything in the vicinity.

Next it would have been necessary, the interest system to be abolished, which is nothing more than an uncontrolled chain reaction in which the money supply is constantly inflated until it detonates in the form of a massive crash. Anything associated with a cancerous growth has no chance of surviving.

Mankind has already had to experience, based on numerous examples over the past centuries, what an interest-bearing monetary system means, but has learned nothing from it, which speaks for the view we hold that it is finally time to develop human intelligence instead of one artificial to speak the word.

A very important point that should have been tackled a long time ago - and that brings us back to the subject - would have been the solution to the energy problem.

There is no question that it is a problem in view of the global dispute over resources, especially in the form of black gold. And we have already mentioned that today's alternative production technologies do not deserve this name, because they are only suitable as support technology.

The only viable solution is the so-called "free energy", which has been the subject of discussion and speculation for decades. Apparently, however, those powers that once created the oil cartel and propagated black gold as well as other conventional energy sources such as coal and gas as the ultimate in the Western and later in the global economic system did nothing in this sector or first, seemingly positive results of various inventors, researchers and inventors were bought up and closed away. They did this on the one hand to keep their highly profitable (monopoly) system alive and on the other hand to be able to exercise power and control over an ever-increasing part of the world's population.

People who are tied to external sources of energy are hanging by an invisible thread, which - if necessary - can also prove to be a gallows rope. At this point we do not want to present any repetitions, but instead refer to the standard work of America

ners F. William Engdahl with the title *With the Öltuaffe to world power. The way to the new world order*, which shows the background of the oil policy, which has a geostrategic character, in a generally understandable way.

In connection with the research on the German nuclear weapon, which has been going on for around 20 years, some partners and we have received clear information on (solving the) energy problem, which appears to be far more explosive than the development of nuclear weapons under the National Socialists could ever be. For us it now stands - that's what we want on this. Emphasize again - out of the question, that the German atomic bombs were ready (and not just in the form of small arms), but for us it is also certain that other projects were carried out in connection with research into weapons technology, first of all the German and

should then also solve the global energy problem - and were quite obviously crowned with success.

And now it's getting complicated - not because it's the topic itself, but because today's public doesn't understand the connections - and thus also the resulting possibilities and consequences. We have found this to be the case over and over again in recent years, as we have often been asked why we were investigating whether the German Reich had nuclear weapons (ready for use) at all. That's all history - and irrelevant or uninteresting for the present.

Are you kidding me? Are you serious when you say that! It's a fact that many people are surprised at what's happening in politics and business these days - and what's happening in Germany in particular. The reasons for this are not only to be found in current developments, but also have something to do with the fact that Germany had weapons systems at its disposal at the end of the war which, had the war lasted just a few weeks longer, would have presented the Allies with insolvable problems. That this representation is not an invention on our part has already been shown several times by military and political circles in the Allies, for example by the US Chief of Staff George C. Marshall, who even claimed that the Normandy invasion of 1944 had become necessary in order to to prevent the use of new German weapons with "nuclear explosives" against the USA. What the Allies found after the fall of Germany, mainly in underground development and production facilities, has not yet been fully disclosed. Much of the most important information is still "top secret" and seems to cause great tremors for those responsible in the USA, Great Britain and also Russia.

It's hard to believe, but it's still a fact: in Kew/London, where Great Britain's National Archives are located (formerly known as the Public Record Office), there are interrogation records of SS officers involved in secret German nuclear research that 100 (in words: one hundred) years are blocked! An incredible fact. Obviously there are things that the responsible citizen living in a so-called democracy must not know under any circumstances - at least not before all the witnesses who come into question have blessed the time. One can assume that if something is hidden from the public for 100 years, these must be quite astonishing things which, if they are released, certain system-supporting, contemporary historical theses - as they were put forward by historians - on the garbage heap of the convey history

would. Not only the devil fears the truth like that

Holy water, no, it doesn't seem to be any different for other people living above ground either.

What is to be protected with the abnormal secrecy is - for us at least - quite clear: that the Allied forces found in Germany what secured them victory in the Pacific War against Japan and subsequently made them military superpowers. Either complete nuclear weapons were recovered or crucial parts of them, for example in the form of detonators, which the United States of America did not even have in April 1945, which is why they gave their technology detection group ALSOS the Wei

sung to keep an eye out for local detonator specialists. But that is not all. There have been likely

also identified developments which the Allies did not understand in their basics and in the way they functioned - and probably have not understood to this day.

For the enemies of Germany was in the course of the ers

It became clear two years after the end of the war that the German Reich, despite fighting on numerous fronts and the dwindling opportunities, was working in top secret and underground on new types of weapon systems that could have brought about a turning point in the war. The Allies realized that a nation that was considered almost defeated was preparing the knockout for its opponents. The only possible course of action resulting from this in relation to the Germans was to keep them under control in the future, to re-educate them and, above all, to channel their economic efficiency. It's not for nothing that billions of euros go abroad today, where they usually seep away without any use.

The search for the German nuclear weapon (and other secret weapons of the second generation) has something to do with 1) rectifying (German) history and explaining the current situation. Their existence would 2) also explain the meaning and purpose of the use of thousands of concentration camp prisoners and forced laborers, who are often forgotten today, but who had to build the underground production facilities in which research was carried out, which has not been done in published historiography to this day may give. In addition, 3) there is a threat scenario for all those parts of Germany in which work was being carried out underground on such weapon systems, such as certain areas in Thuringia. Eyewitnesses said again and again that the most important underground facilities had not been found to this day. So what is in the ground, what is rusting away, what might be dangerous for us living today or future generations?

The officially demonstrated lack of interest in these things is more than obvious in Germany. Strange, given that it should be assumed that every sovereign state has the

contaminated sites lying in the ground should be informed - if only for reasons of averting danger and state liability.

But even the aspects just mentioned do not yet cover all facets of our research. It is well known - and we refer here to corresponding accounts from the 1930s and 1940s, which are not subject to secrecy but are generally accessible in the German archives - one of the main goals of the German leadership was to make the country independent of foreign energy supplies. What is often forgotten: this was not a long-term goal, but rather a short to medium-term goal, in which nuclear physics research also played a specific, pioneering role. For the purpose of realizing this task, the scientific and technical experts also looked outside the box, i.e. they looked for solutions that were quite unconventional at the time. And we can say that these were also found.

There is a reason why we are cautious and reserved about certain things at the moment: some of the information available completely undermines the current world view because it shows that at the end of the war, aspects of a new physics were implemented on the German side, which with the collapse of the German Reiches, however, almost completely disappeared. Interestingly, not only have we reached this conclusion, but also other researchers, such as the Pole Igor Witkowski, have taken this view (note that we work completely independently). But let me say this much: the energy problem was considered solved by the German side at the end of 1944!

In a document reported to us by a previous research partner who claimed to want to publish,

but then it didn't do it after all, it also means that after the end of the war (the author assumed - illusorily? - from a German »final victory«) no German aircraft, no German locomotive, no German ship and in the medium term no other German means of transport would be powered by conventional energy. Instead, any available form of energy would be used, which would revolutionize not only transport but also energy supply.

Particularly interesting: the author of the paper, which he addressed to a high German authority, let it be known that the prototypes with which the experiments were carried out would work without problems and after the end of the war, therefore, large-scale production could be started...

Now, of course, one will ask the question in which direction this technology is to be sought - if one wants to take note of what is written at all, the educated German of today is usually convinced that only that is good, superior and progressive is what is currently being found and produced. But this view is wrong from the start. Much of what is termed "modern technology" had its roots in wartime Germany. After that there were further developments of the basic inventions and a lot of detailed improvements. But where were the decisive technological breakthroughs?

What's the use of the best car, the interior of which is almost like a living room in terms of comfort, if there's still an environmentally polluting one under the hood
ing drive unit tinkering around? Why have no flying wing passenger aircraft or even disc-shaped ones been developed to date, which clearly have better aerodynamic properties? One can not?

Or do you not want to? Or: Do you want to, but can't?! Or do our scientists and engineers only deal with what they understand? Where are the visionaries? Are these extinct?

As far as the techniques used to solve the energy problem are concerned, it should be said that so far only a fraction of what is necessary for understanding the overall (energy-related) situation at the time and the resulting research efforts has been disclosed.

So at the moment we can only give fragmentary indications.

So - but this was only a kind of intermediate step - work was being done on an efficient catalysis process that should make it possible to convert water into its elementary components, hydrogen and oxygen, in an energy- and cost-effective manner. The hydrogen and oxygen were to be broken down, which in turn were to be burned together in engines (to drive certain systems), whereby water was formed, which in turn was used in the catalysis process. No perpetuum mobile, but a cycle.

At this point we would like to point out that there has been a search in this country for years for catalysts that allow water to be broken down - using methods that are not comparable to those that have been and are used up to now. Obviously that was based years ago

a two-page advertisement that appeared in *Der Spiegel*, issue 18/2008, under the headline »Split water could solve our energy problem«. There the Leibnitz Prize winner Prof. Dr. Matthias Beller on the opportunities offered by catalysis. When we saw this ad, we couldn't help but smile a little, knowing that the catalysts in question had long been found - from which our current research is based

however, knows nothing. Again, catalysis research was successful in the 1940s, but was no longer seen as a supportive or transitional approach to solving the energy problem.

As an addition to the subject of "catalysis" - and because it fits the content of this book - this much: Around the fall of 1944, a production mode (not an enrichment process!) for the "bomb materials" was developed on the basis of such a process, with which it was ultimately almost child's play to provide the German nuclear weapons with their "fuel" (compared to the previously known methods: ultracentrifuge, diffusion, incubation in the reactor, irradiation and so on). Today's physicists with whom we spoke about this state of affairs claimed that this procedure is theoretically feasible, but that practical implementation is impossible in the absence of suitable (chemical)

Catalysts have not yet succeeded and are probably still a long way off. To shed some more light on the matter, we give the following tip: deal with German silicate research during the 1930s and 1940s, investigate the (partly secret) use of kieselguhr deposits in the German Reich and also do some research the top-secret research of Alfred Nobel's explosives factory in Geesthacht near Hamburg - the location where the GKSS company and the Krümmel nuclear power plant were established after the war. Possibly some things will then become clearer (or - in view of the limited perspective of today's science - not).

According to further available information it succeeded - and That is what is actually astonishing, because the -, the breakthrough in making so-called zero-point energy (sometimes also called gravitational field energy) usable, whereby it is, and this should not be concealed, a chance discovery

acted. Both civil and military

As far as the realm is concerned, the results of this discovery were literally resounding, and one is fortunate that the military component was held back by the science team that developed it when the war ended. It was the Reich's third miracle weapon, the name of which we have already mentioned and which, if used, would have made Hitler's *Götterdämmerung* a reality - and against which an ordinary nuclear fission weapon was a toy.

What became of the civil applications is largely unknown, not because there is no further information on this, but because the people who were interviewed years ago and who have this information did not want to divulge it. When asked about the reasons for this behavior, we received no answer.

What kind of feeling must it be for a "knowledgeable" person to know the solution to the "world problem of energy" but to withhold it from "modern civilization"? Has the

Doing it all with later revenge or is there a reason still in the future of mankind that is unknown to us or is being withheld from us? (We'll come back to that in a moment.)

Whatever the answer to the last question we posed, there is now evidence that a solution to the energy problem that scientists and engineers hope to find may have been provided in the past. A more grotesque situation is hard to imagine: while some are looking for the key and wandering around in the dark of night, others have long since found it and put it in the lock to open the door to a new, energetic, light-flooded world - but are under no circumstances ready to admit that publicly.

The fact that this state of affairs must appear so grotesque has something to do with the one-track nature of today's scientific system. Instead of tackling what seems impossible in order to extract the maximum of possibilities from it, people are largely concerned with improving processes, devices and methods that have been known for a long time. This is nothing more than bean counting and navel gazing.

At this point, an (explanatory) consideration on our part as to why knowledge of certain technical developments is being withheld: In talks held years ago, we were told that some of the "wonder weapon" teams decided in the chaos at the end of the war, certain things never until the day when mankind has matured mentally and morally to the point where it can draw the right lessons from the existence of all-destroying weapon systems.

Certainly: That sounds like a contradiction in terms in view of the announcements made by some Nazi protagonists that Germany would only be left to the enemies in a completely destroyed state. Man In this context, however, one must know that certain developments of the National Socialist leadership remained unknown as far as their *actual* state of research or development was concerned, for example those that were located in Bohemia-Moravia, in the vicinity of Prague and Pilsen. The moral descent of mankind since the 1940s, which can still be clearly seen in the armaments expenditures after 1945 to this day, is possibly a reason why the "in the know" remain silent and remain silent. Strictly speaking, the complete disclosure of new, revolutionary energy production technologies would also immediately lead to enough crazy »Dr. Strange" Weapons Utility

applications would develop - the fear of real or imagined enemies is now so great that ghosts and threats are seen everywhere.

The level of destruction that ranks above nuclear fission and fusion weapons - which can already destroy large cities up to parts of nations - would be the complete annihilation of the planet. Are we humans at the beginning of the 21st century mature enough to peacefully apply the knowledge that has existed since the 1940s?

No, we are not - on the contrary, we are further away than ever from the ideal image of modern man as a representative of a morally and ethically superior civilization that we should actually have today. Just look towards the United States to see what we mean. If this leading nation, as it likes to call itself, possessed the knowledge we have mentioned - we would long since have been circling as dust particles in our solar system, which is reduced to the planet Earth.

But let's get back to the everyday problems associated with the lack of cheap energy. A constant theme in this country is the ben

interest and diesel prices, which are state-tolerated terror at the gas station. If you consider that in the first half of the 1990s the price for a liter of diesel was still 90 pfennigs per liter, but today prices of over 1.30 euros (i.e. around 2.50 German marks) are not uncommon, then you have to realize that a development has started here that can only be described as crazy. This effect of insanity is further reinforced by statements by certain politicians painted green and red, who claim that expensive energy uses the environment, but which themselves tens of thousands of kilometers with their 6-cylinder bigwig catapults

drive through the area every year and pollute the environment to an extent that is unbearable.

It will be interesting to see what will happen once the plans to introduce a carbon dioxide tax (some also call it a tax) are implemented. In recent years, many motorists have been seething with anger at the high fuel prices, especially those who, for professional reasons, are forced to commute many kilometers back and forth between their place of work and their place of residence. Meanwhile, the federal government is rubbing its hands, because every cent by which the price of fuel increases also increases the taxes that are levied on it - and with it the state coffers ringing loudly.

We would perhaps act a little more cautiously if the tax revenues also benefited the country, its people and the infrastructure in sufficient measure, but this is clearly not the case. On the contrary: the number of defective bridges, roads and school buildings is increasing.

Although our federal politicians take an oath of office in which they swear to avert harm from the German people, it has been clear in recent years that exactly the opposite is happening: the cart is being pushed further and further into the dirt, figuratively speaking, because those , which they should actually pull out, have neither vision nor ability. And the gossip of some politicians, which was often heard in the past, that they want to take action against rising prices at the pump, was, as it turned out, hardly to be taken seriously, but only had a valve function. The (ver)dumb(t)e German Michel was once again duped - as so often in his recent history.

Just imagine, tomorrow would not only be Carbon dioxide emission is a reality, but also that of many

feared war against Iran begins. What would the consequences be? There are certainly numerous theoretical schemes that can be played with, but one thing is certain: an exploding oil price that would automatically lead to further price increases. And when we say "explode" here, we really mean it. A liter of petrol or diesel, including the disguised breathing carbon dioxide tax, should then hardly be available for less than two euros; if the matter escalates, even the deviant cranks of the Greens, who once spoke of five Deutschmarks, are likely to be caught up in reality. We now have the impression that all of this is intentional and that those responsible intend to squeeze every last drop of blood and sweat from the citizen. What happens after that remains to be seen. Even if the Germans are not revolutionaries, they will still have to react in self-defense. We are already looking forward to this day, we are actually looking forward to it, because - and in this regard one should not indulge in any misconceptions - the prevailing system is just pure madness, not sustainable and is eating itself and its children. The French are already giving their President Macron hell because of increased energy costs and have been for months

protest, it's still quiet in this country. Still. We have nothing against getting French conditions in the near future. The yellow vests are ready.

Hard to believe: In Germany, due to the constantly rising energy prices, a six-digit number of people have their electricity cut off every year because they cannot pay their bills. According to estimates by consumer advocates, there were around 300,000 in 2017. What progress - and that at the beginning of the 21st century!

Electricity does exist, but you can simply get it

away. We have come a long way in our civilizational development, so far that some are forced to think about the heating and lighting methods of our ancestors.

In this context, one must not forget who has additionally strengthened this tendency to rising prices: Mrs. Merkel, long since deserted by all good spirits, said goodbye to nuclear energy with a lonely decision in a hurry, but had no plan for a real cost-effective alternative. Of course: In the future we will hardly be able to be irradiated by German nuclear power plants. But then maybe soon the

Cases in which people freeze to death in winter in this country are increasing - especially if the information provided by Russian researchers, who predict a significant cooling of the climate and freezing winters in the future, is correct. Coupled with the left-green plans to introduce a carbon tax, that's a deadly combination indeed.

One envies (satire beginning) the one who once lived in caves and sat by the warm fire
Prehistoric man who was still self-sufficient and would pull a part on anyone who talked stupidly into his affairs - with the ready club. Those were the days!

And what kind of times were those when highwaymen, robbers and thieves who attacked careless travelers and "freed" them from their belongings were considered outlaws and could be hunted down by anyone. Today one also travels from A to B and will
plundered on the way as well. The only difference: the robbery happens on every trip, and the victim has no way of defending himself because the state is the robber (satire end).

We think: forward to the past, things were simpler, better - and people were more straightforward.

Today, on the other hand, in many places in this country in particular one only finds cowards, cowards, reality blockers, professional optimists, those who resist truth and advice, and those whose backbones were removed immediately after birth. Shame on this society, which calls itself open, but is no longer completely closed because of sheer openness, runs after the EU and other pied pipers and has no solutions for the problems at hand. A high-tech society that leaves hundreds of thousands of people in the dark is the best example of the perfectly staged and bureaucratically administered madness that is unfolding before our very eyes and is getting worse and worse. It's high time to take a stand against it or, if you don't want to or can't, to largely withdraw from the system.

The main beneficiary of the high fuel and energy prices is, and we must emphasize this at this point, the state. It is said that we (the citizens) are the state, but only South Sea islanders on their distant islands believe that. Mrs. Merkel hasn't been able to stop laughing for years

the sleep. It's safe to assume that she doesn't give a single thought to those who are suffering from these high prices - and there are many

people in this country. And anyone who thinks that the increased fuel costs can be (partially) deducted from taxes in the form of a higher mileage allowance will be disappointed anyway. The German government is not willing to pay even one cent more.

Interesting: even in some developing countries
Fuel government subsidized to the concerned
To give at least a small benefit to peoples, with it

they realize that governments are willing to do something for them. In this country is only ripped off, what the stuff holds. In particular, the top performers, i.e. those who get up early and (have to) spend their day at work, can sing a song about it.

We have a good friend who has a sharp mind and only says, "Mr. Spock« because he analyzes states purely logically. He thinks that if the costs are increased further without compensation, the Germans should all refuse to work. Where there is no work, there is no production and service. And of course no sales and profit, so no taxes. Even a week of total refusal to work would bring the system to its senses, because without tax revenue, Mrs. Merkel is as helpless as a frog in the desert.

Of course, such a scenario "Imagine, it's work - and nobody goes there" will not occur, because the divide-and-conquer manipulation techniques will always cause a large number of contemporaries to step out of line and torpedo the success of such boycott measures. We know that from German history: Ever since Arminius, there have always been traitors who worked for foreign powers and served other interests. They should be rotting in hell to this day.

Some of our readers have written to us in the past to boycott certain major oil companies. No one should go to the expensive gas stations anymore, but only frequent the cheaper filling stations, so that the big ones are forced to lower their prices in order to attract customers again and boost competition.

In addition, the corresponding boycott must be spread nationwide via e-mail and the Internet. After all, everyone has relatives, acquaintances, friends and colleagues who

he could inform, so that a kind of chain reaction would take place if the calls fell on open ears.

In this context, some people will now think that they unfortunately live in an area where there are only branded petrol stations. Then the following applies: In this case, the person concerned has to drive a few kilometers further, take a ten-liter canister with them and fill it up right away in order to at least reduce the frequency of visits to the gas station a little. Maybe your neighbor will do the same for you, it doesn't cost anything to ask. A boycott requires awareness, flexibility of thought, cooperation, and sometimes sacrifice of one's own for a period of time.

There are a lot of citizens' initiatives in Germany. Why is there no BRD-wide initiative against the rip-off at the petrol pumps or the outrageous electricity prices? And where are all the automobile clubs? Years ago we wrote to the ADAC and suggested that they organize a trip to Berlin and paralyze the infrastructure there by means of mass protests. The response was typically system compliant and does not deserve mention here. Since then, our motto has been: ADAC, no thanks!

Our personal opinion is that a really intelligent, mid- to long-term oriented solution has to go much further and look very different. It must present itself in such a way that the multinationals, those who make money from the chaos of the energy transition, and their political lobbyists are slowly but surely starved to death by giving them their license to print money through oil production and marketing or the provision of the technology for the use of so-called of alternative energies, which in reality are not, and introduce those technologies that have existed since at least the 1940s and - for example - lie safely hidden in German soil.

As we have stated above, during the Second World War, German scientists and engineers created solutions for energy self-sufficiency that are beyond the imagination of today's average consumer, but which nonetheless already existed in prototype form. Now, of course, every politically correct person is going to start yelling "Yuck!" because we made reference to the millennium, which lasted a full twelve years. However: Even the most zealous do-gooders, greens, leftists and anti-fascists have been seen - as can be heard - already driving on German autobahns, the original routes of which were created at that time. So why discuss any fictitious contact problems. No ideology is required here, it's all about finding a solution!

We want to tell you something about the inside story: As a person interested in contemporary history, science and/or technology, have you ever heard of heavy air? No? Well, we're not surprised. After all, no one is willing to listen, because most fellow human beings believe that they possess the all-blessing knowledge, which, however, is only the "knowledge" that is given to them so that they can continue to remain in the modern slave status. heaviness

Air is not liquid air, but a special kind of fuel, based on a real (new) physics, of which a few liters are enough to let special machines fly around the world.

Have you ever heard of a device with the Heard the name "Theophil" that produces its own fuel? No? But then you have a huge education gap!

Or do you know the Kammler batteries, which are as big as a mono cell for flashlights and last up to 100 years

work and - that's the best part! - be able to charge themselves automatically?! Not again? Then you have to acknowledge that not only are you ill-informed, but unfortunately you don't even know that there is a nature-conforming technology that was already being used in the 1940s and whose most outstanding exponent was Nicola Tesla (whom you but maybe you know it now).

The Germans developed useful applications from the processes that Mr. Tesla created, because they wanted to make their country largely independent of energy and later also raw material supplies of any kind - which, incidentally, gave them another reason for Anglo-American high finance and its stirrup holders delivered to destroy the German Reich.

If this technology were understood, studied further, and implemented rigorously, virtually all oil, gas, and coal infrastructure could be thrown into the dustbin of history - where it logically should have been for a long time. And good news for those who criticize the disfigurement of the landscape by wind turbines: these bird shredders and insect exterminators can also be disposed of.

Before that, however, one should take a few pictures of them, so that later history books (if there is still someone who writes them) can document an example of ignorance and stupidity at the beginning of the 21st century using a few photos.

With the abolition of oil, gas and other conventional energy suppliers, those swamps would also be drained that are now populated by loudly croaking frogs, all of whom think that there is no alternative to them and their type of energy management, but who actually say with every word that speak them out, show that they still

never realized that we are surrounded by a sea of energy just waiting to be harnessed. Solar energy is the starting point, but by no means the ultimate.

We think that the time for the new technologies, which are not that new because they come from the 1940s, is overripe, since with them a real (consciousness) development of mankind would begin. In addition, an environmentally compatible (!) technology would be used, not this creation-destroying nightmare, which also includes the wind turbines, which some contemporaries in all seriousness describe as "progress". If anyone should not understand what it is about, then here again clearly and clearly to write down: What the rulers today really wanting is total control of the individual because, contrary to what is said, the individual is more powerful than the government. This control can be achieved by making it dependent - on food, housing and above all on energy, without which modern society is indispensable. Now imagine that you had an appliance in your basement or in your apartment that was about the size of a small refrigerator and would supply all of the energy for your life by taking it from the space around the appliance. Would you then let monopolists tell you "something about horses"? No, because you would be free and independent in that regard. And once you have experienced true freedom, you will strive to extend it to other areas of life. The citizen would become so powerful that every government would be afraid of him - and that would be a good thing!

Then politics would have to be in the name of the people and of the conscious (!) citizens - and not in the name of some "elitist" structures in the form of a corporation and fi

nanzoligarchy with its lobbyists and propagandists who will lead us to catastrophe.

Of course, the new technology would also have a tremendous impact on society in general, because all behavior and life patterns, our sometimes bestial dealings with our fellow creatures, which are only declared as "things" or "things" (a serious crime of a particularly perfidious kind, in our opinion must be combated with all conceivable means), would have to be put to the test or changed. Only then could one speak of the beginnings of a civilization in relation to the currently existing human barbarian society (exceptions prove the rule). The lack of culture, which is based on an economy based on conventional energies, must finally and without alternative (that's the right word, Ms. Merkel!) to be eliminated.

If you ask us specifically what the starting price of this incipient transformation is, the answer is a relatively simple one, one that one of us gave years ago and has subsequently received a plethora of letters from people wanting to lend a helping hand. Although Mr. Mehner was not in a position to answer all requests to speak at the time, and due to other, unforeseen circumstances, the topic had to be put on hold for the time being - partly due to the fact that a team of scientists, which was initially very optimistic, was one of the To be able to analyze and understand the functioning of the Kammler batteries already mentioned ultimately failed. The processes taking place in it have not been understood to this day.

(Some contemporaries would argue that the time was not yet ripe.)

Mr. Mehner's answer at the time, which in principle is still valid today, was:

"At first, a low six-figure sum is enough to set certain things in motion. There are enough clues, connections are made. And the offer stands. Moving forward requires good allies who are willing and determined to tackle the issue. Cowards and doubters are just as unsuitable as people who work for certain institutions (they are quickly exposed thanks to years of experience in dealing with the "wannabe slouchy hats".)

One more thing: many people are afraid of change because they don't know what to expect. I'm saying: if things are allowed to continue as they are, Germany will be plundered - and then you don't have to worry at all; Your life is then a single worry. In Europe, only bankruptcy vultures are sitting in the trees, and the anger of those who are getting under the wheels as a result of the debt and system crisis will ultimately be directed against the Germans. Smarter people than me claim that this is exactly the plan to rob us of our economic strength and, after defeat in two world wars, to teach us the third, all-important one.

If you look at things from the perspective just described, some abstruse political phenomena become completely understandable. We should therefore ask ourselves three times a day who our political "elites" serve. The German people? Or completely different interests? i know the answer Do you know her too?

What is certain is that it is now about the freedom of each individual. Every cent that has to be spent on petrol and diesel and our quality of life

diminishes, presses us deeper under the knout of those who rule us. Let's defend ourselves by leaving the old ways, which are all just wooden paths, and looking for new solutions. A start has been made. Come with me?"

While we were still quite optimistic at the time that we would be able to understand the old and new technology and bring it to the people, hopes were dashed because of the aforementioned failure of some experts, who were initially firmly convinced that they would get behind the functional principle of the batteries. Ultimately, they too had to realize that all their knowledge and experience were not enough to decipher the battery secret. However, they were not alone in this: Years before, experts from Skoda and a German car manufacturer had

stood at a loss in front of the batteries and the measurement logs. Some even refused to accept the values they determined, that is, they refused to sign the final investigation reports that we have. The whole thing is an example of the fact that some of today's engineers and scientists behave like a stuffed goose that cannot eat another bite.

At the end of this chapter we would like to present a few key data relating to the old and new technologies, specifically in the form of Kammler batteries. In doing so, we want to limit ourselves to the most important aspects and draw on a document that we have already prepared in advance for a few people who are particularly interested:

»[...] Numerous interested parties wanted to know why things like heavy air, the

heard nothing about his own fuel-producing device "Theophil" or about the so-called Rammler (or Eternal) batteries. The answer is simple: because there was no access to certain historical circumstances and facts for a long time - and only through research on the topic > German

Atomic Bomb< clues could be found, according to which German scientists and engineers dealt with various questions, which among other things concerned the solution of the energy problem, in top secret and shielded projects until the end of the war in May 1945. [...]

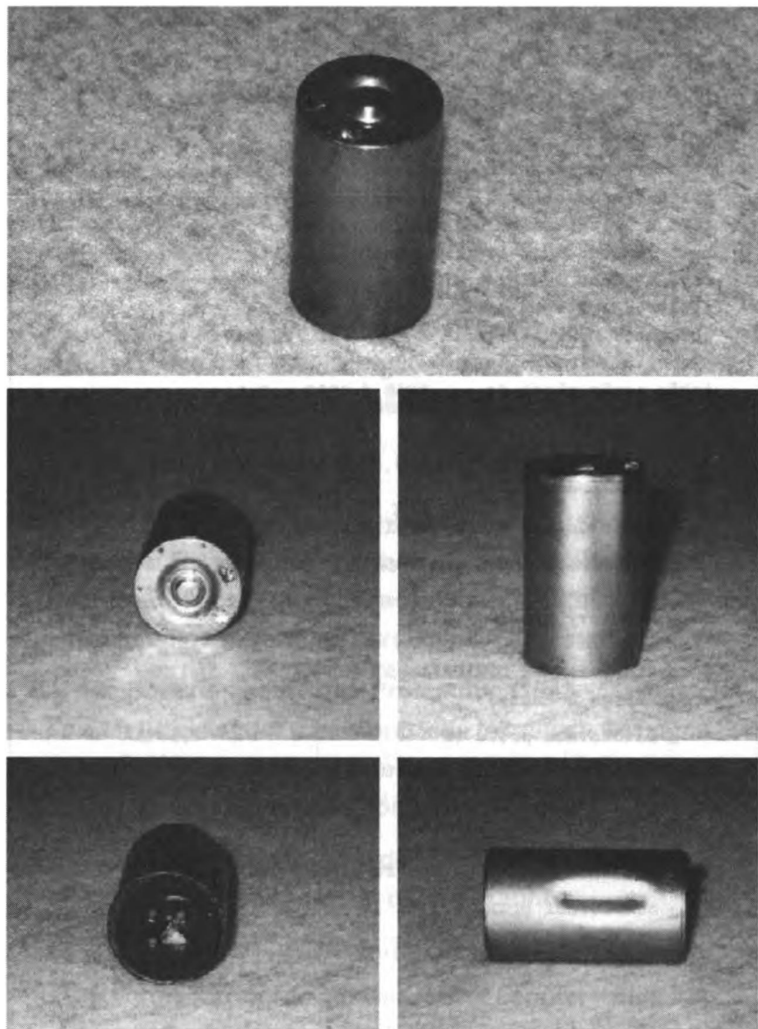

We cannot explain here in detail what would be worth reporting on this topic [...], so we would like to limit ourselves to the so-called Rammler batteries as an example. The fact is: You will hardly be able to find anything about these developments on the Internet, as they have not been discussed so far. Just this much: A number of top-secret German projects that dealt with post-nuclear developments during the Second World War were not disclosed to the Allies, or only as rumours.

At the end of the war, the SS made sure that the prototypes and documents disappeared underground in secret depots, where most of them are probably still lying today. The attempt by the Allies to get some of those involved to speak after the war through long periods of imprisonment (and torture) failed in most cases, including SS Oberfuhrer Emil Klein, who had been in what was then Czechoslovakia for almost 20 years was held captive to elicit his knowledge from him. Klein was commander of one

military training area in the former Reich Protectorate Bohemia and Moravia and as such for security certain scientists who worked there on new processes that served to create a super explosive and solve the fuel and energy problem. At the end of the war, the research results of the scientists were hidden in an artificially created cavity by the SS engineer battalion commanded by Klein [...] which has not been opened to this day (mined; danger to life), but which the Czechoslovak security authorities used after the war strongly interested for years.

Based on documents first appearing in the 1990s that a film producer in the archives of the Ministry of the Interior in Prague, what was just reported was initially shared with a small circle of People known, but not (yet) fully understood in its meaning, especially since it is Research mainly about the whereabouts of the amber zimmers and the technological component only came into focus while working on a film, when suddenly there was talk of so-called »special weapons« and »developments«.

Furthermore, it is important to know that, to stay with the example of the batteries, a Czech treasure hunter in the 1920s at Stechovitz, which is in the wider area of Prague, came across an underground system in which he found a case with them. The batteries were not labeled and initially appeared to be normal mono cells. In their use (they were used to

One of the Kammler batteries used in the 1960s Stechovitze were found and their functional principle could not be clarified to this day. They do not require a charger and work for decades easily.

VÚET 8563 1. č. 3

Pro porovnání charakteristických hodnot obou rozměrově odlišných baterií, t.j. zatěžovacího proudu pro konečné napětí 2 V, vnitřního odporu a zkratového proudu, bylo vytvořeno jednoduché kritérium. Charakteristické hodnoty rozměrově menšího litiového článku jsou přepočteny v poměru ploch elektrody, kterou tvoří vnější plášť článku, t.j. plocha elektrody měřené baterie - $\chi \cdot 32,7 \cdot 58 = 5958 \text{ mm}^2$
 plocha elektrody litiového článku - $\chi \cdot 18 \cdot 34 = 1923 \text{ mm}^2$
 takže poměr ploch je - $5958 / 1923 = 3,1$

Výsledky měření

1) Baterie dodaná zlepšovateli

- zatěžovací proud pro napětí 2 V	... 9,2 A
- vnitřní odpor	... 0,083 Ω
- zkratový proud	... 30 A / 1 s 26 A / 5 s

2) Litiový článek DURACELL DL 123 A naměřené hodnoty:

- zatěžovací proud (2 V)	... 2,56 A
- vnitřní odpor	... 0,286 Ω
- zkratový proud	... 10,2 A / 1 s 9,1 A / 5 s

přepočtené hodnoty v poměru ploch elektrody:

- zatěžovací proud (2 V)	... 7,94 A
- vnitřní odpor	... 0,092 Ω
- zkratový proud	... 32 A / 1 s 28 A / 5 s

A supplement to the 1996 investigation protocol informs:

»GERMAN BATTERIES [...]

Date of Manufacture: 1943-44

Test series: 1996

[...]

The following were tested:

- a) Behavior under load**
- b) discharge behavior**
- c) short-circuit behavior**

The tests were carried out on 03/01/1996.

[...]

**In these tests, the above battery type was compared with a
Duracell Size DL 123A (Lithium
manganese dioxide battery) manufactured in 1996.**

**The batteries of German production (1943-44) are concerned
it [each] is a monocell with a liquid
Electrolyte in a steel jacket, diameter
32.7 millimeters, height 58 millimeters.**

**The composition of the electrodes and the
Electrolytes are unknown.**

[...]

**A plastic was used for potting - a kind
Epoxy resin that expands even at temperatures above
280 degrees Celsius not deformed.**

**The steel jacket also withstands very high pressure
loads and does not show even after 50 years
the slightest sign of corrosion.**

[...]"

running a truck lightbulb to light up a basement) turned out to be anything but normal as they worked practically forever. They were over a period of around

In use for 30 years and recharged automatically after the consumer had been switched off. Without any form of charger, mind you!

In the 1990s, the first non-private study of the batteries and their properties was carried out by a large, well-known company in what is now the Czech Republic. The engineers were quite puzzled as to the function of the battery, which was also reflected in their report, which is available. Subsequent attempts to understand how batteries work also failed, which is why nothing more was heard of these developments for some time.

In 2010, one of the owners of the batteries attempted to sell two of these for a six-figure sum, but was unsuccessful at the time.

No one believed the properties he reported for the batteries. In the meantime, a battery from another source has been secured.

That means in concrete terms: We don't have any of us here and Access to newly developed free energy technology today, **but a prototype from the 1940s that works according to principles that are considered almost impossible.** And these principles must now be researched in the future in order to understand how the battery works. [...]"

As we have already informed, this prototype was examined by a hopeful team of scientists,

but after some time gave up in exasperation because the battery was functioning in a way that remained a mystery to the experts.

The source that supplied the battery was a German physicist who had been trying to understand how it worked for years on his own and with his own resources. He hadn't had any success either, which is why he put them up for sale.

Before him had a Czech chemist for many years also tried on a private initiative to get behind the functional principle of the batteries. When trying to open a battery, it exploded - with extremely unpleasant consequences for the chemist.

Below is some information on the development history of the batteries. For the sake of completeness, it must be pointed out that there were originally two different battery variants with almost identical appearances, with only the self-charging one ultimately being of interest for our considerations.

The American author Henry Stevens, who also dealt with the batteries, assumes that none other than Prof. WO Schumann, who has already appeared in connection with other unusual developments during the Third Reich, at least up to 1943 was busy developing and supplying a battery at the Technical University of Munich

manufacture, which had a high energy density and could withstand very low temperatures. The loss of effectiveness (leak) was one percent per year. These batteries had an internal pressure of 3.5 atmospheres and looked like normal steel-cased designs that

had a notch on the outside like a predetermined breaking point.

The meaning of this notch, which all batteries had, is

however unknown. Stevens and others claim that the *non-self*-charging battery variant continued to be used in modern military missile technology after the war ended.

Our own research indicates that the development of batteries began around 1937. One of the most important men involved was the physicist Ronald Richter, described by some contemporaries as a genius. American threats sabotaged. Richter was verifiably in Thuringia in the late 1930s and worked here, among other things, for what was then the Suhler Waffenwerke in a special electrical engineering department. What he did there, however, remains unclear to this day.

Due to its importance, the project was coordinated by the SS from 1939 and there were several generations of these batteries, with the examples manufactured from 1943 reaching the known state of affairs.

The SS only issued copies after examination for important scientific and technical projects, but later also for security tasks. One possible application was that of stage separation in large rockets, a second use for booby traps in underground systems that had to function independently over a long period of time (several decades). But it certainly has more Ver

possible uses. There were also rumors of use in submarines.

The batteries have a service life of *at least* 50 years, but should easily reach the 100-year mark with normal treatment. The systems are pressure-stable, resistant to cold and heat (from space temperature to

to about 280 degrees Celsius) and have the aforementioned steel jacket, which does not oxidize and also easily withstands any acid attack.

One of the owners of these batteries explained that they are developments based on 3,000-year-old technology. That doesn't seem impossible when you consider that there are numerous unanswered questions in relation to millennia-old cultural legacies, which also suggest the problem of the availability of usable energy for lighting purposes.

We also pointed out that the Ahnenerbe was looking for exactly such legacies and was said to have been successful.

After the Kammler batteries were reported for the first time years ago, there were of course also critical and negative voices, according to which the batteries did not exist at all or were fakes. Well, we have had the batteries in our own hands several times, we have the test reports and know the people who have been dealing with the batteries for years.

Incidentally, we know where one of the batteries is stored in this country and that there is an old gentleman who still owns several of them outside of Germany and, as reported, has tried to sell them several times over the past 20 years. The problem, however, was in most cases that those who had the money to purchase thought the reported properties of the batteries to be impossible, while those who thought they were exceptional specimens of German high technology existing in the 1940s usually did not have the financial means to purchase them. However, there were two exceptions, otherwise the batteries and their properties would never have come to light.

"Whoever hides the danger is an enemy."

Johann Wolfgang von Goethe

epilogue

Valentin Falin (1926-2018), the well-known and well-known Soviet diplomat and author, who is certainly still well remembered by the older generation, who was Ambassador of the Soviet Union to the Federal Republic of Germany from 1971 to 1978, wrote in his work *Zweite Front. The conflicts of interest in the anti-Hitler coalition* (Droemersch Verlagsgesellschaft Th. Knaur Nachf., paperback edition, Munich 1997) on page 12:

»After the occupation of Germany, the US government took possession of huge archives of documents from the Nazi empire. They had material of inestimable value removed from, among other things, Hitler's last headquarters, called Olga, which had been set up in the utmost secrecy, and from the secret depots that the Nazis had set up in Czechoslovakia.«

Remarkably, to this day the Americans have given up almost nothing of what they found in and near »Olga«, which existed in the Thuringian Jonas Valley and its surroundings. Likewise, little has been published regarding the emplacements in Bohemian-Moravian. In both cases, it was probably not only about military, political and secret service information, but also about information that had to do with German technological developments.

Safe: The troop advance reports, which also contain references to underground production facilities and depots, have now been released in numerous cases.

But there is just as much silence about the contents of the underground production facilities mentioned in them as about the contents of those German documents stored in the secret depots.

More than 70 years have passed since the end of the war - and it is a scandal of a very special kind that to this day we are not allowed to know what was so important to the protagonists and responsible departments of the Third Reich that it had to disappear underground. One would think that the spoils of the Allies had meanwhile been through since the end of the last great slaughter of nations in recent decades is outdated in its importance, but that is obviously not the case. What can be so important and/or problematic that it still has to be held back?

In this book, as in previous ones, we have attempted to provide a partial answer to this question, believing that much of what is still classified has a technical background that should remain unrecognized: that the constantly self-aggrandizing USA, as well as the allies England, France and the Soviet Union associated with it in the Second World War, completed a raid in Germany such as the world had never seen before. In doing so, they stole all those technologies that made two of them become superpowers after the war: the atomic bombs, rockets and many other things that had originally been invented by German scientists, engineers and technicians.

If we hadn't found out years ago about the mini nuclear weapons test at the Ohrdruf military training area through certain contacts, the Allies would have been successful with their method of concealing it. But things turned out differently.

We have often been accused of being »obscure« because we have not cited them in numerous cases

have (which we justified several times). We have to clearly disagree with this accusation, because afterwards it became apparent - and this is understandable for anyone who has not yet completely lost logical thinking - that our sources provided correct information. They claimed, for example, that in the first half March 1945 two tests of new weapon systems took place in the area of the "Triangle" at the military training area in Ohrdruf.

Experts are arguing about the date of the first weapon test: whether it was March 3 or 4. Curiously, these two tests were completely unknown until we disclosed them. Until then, there was no mention of it anywhere. Further research, for example by the Berlin economic historian Dr. Rainer Karlsch

in Russian archives, revealed that the then Soviet military intelligence service GRU, for example, was well informed about these two secret experiments because it had an agent on site. This means that our specifications were later confirmed (apart from the soil sample investigations that we mentioned earlier in the book). Isn't that remarkable?

The fact that our critics only have the answer "No" does not have to affect us, because it allows certain conclusions that we do not think we need to explain in more detail here.

From a factual and logical point of view, it remains to be noted that the truth about the two just mentioned German German home weapon testing took until about the year 2000 to appear. She was therefore unknown for 55 years. Five and a half decades is a long time in which, unfortunately, many of those who could have said something on the topics that interest us have left us - which is an irretrievable loss, because they disappeared with them

also lots of information about events that should have belonged in the history books, never to be seen again.

It remains to be seen whether these events can be reconstructed. In any case, the former Allies have no interest in supplying the missing pieces of the historical jigsaw puzzle, but jealously keep them to themselves, true to the motto that knowledge is power.

However, they are not in exclusive possession of what we call the "missing knowledge," some of which has been transmitted to others and to us years ago. So does that

The fact that the Allied scavengers did not find everything that was important during and after the end of the war - especially not the most important and progressive things. So there is still not only the chance to make amazing discoveries, but also the option of (German)

To turn historiography upside down one day. When that will be, we cannot predict either. But at the latest when some of the storages that have been taken underground and that have become problematic in the meantime report in the form of a more or less comprehensive meltdown, everyone will know that the claim that "there is nothing there" was a lie.

Attachment

In the following, we would like to inform our readers of an interview that took place in May 2016 after the publication of our last book *And they had them!* with one of the Au

goals. This interview appeared on the *KOPP Online website*, which has since been discontinued and replaced by the *Kopp Report website*. For all those who could not read the interview at the time, it is therefore presented here again in printed form. New information that emerged in the meantime was added to the interview as necessary by placing it in square brackets.

**»Hitler's atomic bomb:
The Nazis had up to
two decades ahead«**

Editorial office *KOPP Online*

Thomas Mehner's book with spectacular new evidence about Hitler's atomic bomb is making waves. The Nazis are said not only to have been up to two decades ahead of the Americans, they also developed a super explosive substance with unprecedented effectiveness. Mehner and his co-author Edgar Mayer use new facts, documents and testimonies to shed light on what mainstream historians are still hiding. But the authorities continue to wall up, which could pose great dangers for the population, especially in the area around the Jonas Valley in Thuringia. Markus Gärtner has met with Thomas Mehner

talk about his book...

KOPP Online: You published your first book 15 years ago and said that Hitler had the atomic bomb. Now you have followed up with a new book at Kopp. How did that happen?

Thomas Mehner (TM): Since 2001 I have been with

I have written several books on the subject with my co-author Edgar Meyer, the last of which was published about five years ago. So it was time to hear from us again, to counteract the impression that we had shelved the issue and ended our activities.

There was also some interesting news to report which, among other things, the strange drilling activities of an Israeli

Foundation south of the village of Gossel, in an area where fox and rabbit say good night.

KOPP Online: Mainstream historians take it for granted that the National Socialists could not build nuclear weapons. She

describe in their book the revision of numerous components of contemporary history as unavoidable. What do you mean by that?

TM: It is well known that history is always written by the winner. We believe, however, that the loser should also have the opportunity to present his or her point of view, because otherwise all claims that one can learn something from history are taken ad absurdum. We also believe that the victor is willing to lie about certain things, especially when it comes to presenting issues that are extremely important or embarrassing for them. And the German atomic bomb was very important!

Years ago, by chance, we came into contact with eyewitnesses who reported to us about the events at the end of the war in Thuringia, which had been kept secret until then, and believed that the most exciting chapter of that time had not yet been written - namely, among other things, that of the development of the German atomic bomb. The subject electrified us as, over the years, we were able to piece together piece by piece of the puzzle that, taken together, created a picture totally at odds with mainstream historian historiography on the subject.

We are of the opinion that if the true story of German nuclear weapons development were to be uncovered, many things would come to light that the alleged superpower USA in particular should not like at all. A contemporary witness, who incidentally held a high political office in this republic, once said that what happened in

Thuringia once happened, if it were disclosed in its entirety, the Germans would sever all connections with the USA for 100 years. Years later, an officer at the Ministry for State Security explained that the issue could bring down entire governments.

Such hints made us really curious, although I have to add that the topic is indeed a »bomb« because what has been researched so far shows very clearly that not only is there a lot of blood on the hands of certain people, but that there is an unbelievable story of betrayal and sabotage unfolding here that unparalleled. Once you have understood the dimensions of what happened there, you no longer have to wonder what happened in Germany after the war - and what is happening to this day. The descendants of those who committed the treason hold various political offices. Incidentally, and this is a particularly interesting component, many of the traitors and saboteurs were members of Freemasonry, although these ranks did not sit in the lodges that were dissolved by the Nazis and whose members were sent to concentration camps.

KOPP Online: What are the most important clues, facts and documents that you have found since the publication of the first book about Hitler's atomic bomb?

TM: It's hard to judge here, so I just want to make a few points. Through the research of partners and through our own, we have found a number of documents that massively question the "knowledge" that was valid until a few years ago, according to which the Germans were not able to develop a nuclear weapon. American intelligence officials wrote reports proclaiming, for example, that the Germans were the first to realize that combining a missile (V-2) with a nuclear warhead was the ideal weapon. It was also the representatives of these US secret service structures who referred to an important physicist, Josef Schintlmeister, who went to the Soviet Union after the war

went, informed that he and his research colleagues during the War all elements up to the one with atomic number 105 identified and isolated! The Americans and Russians managed that only a good 20 years later, from which one can clearly see who was really able to develop a nuclear weapon. In other words: the Germans obviously had up to two decades ahead and had facilities that could produce these elements. How little the public knows about such things, but how megalomaniac it pretends to be an information society, can be seen if you look at *Wikipedia* [May 2016] what is written there about the name Josef Schintlmeister. What is published there is a joke. [This also applies to May 2019.]

In addition to these document finds, it is above all the time testimonies which we have collected and which, unlike establishment historians, we value very highly, for many of these contain details of the locations of underground facilities which could later be verified by ground penetrating radar or the use of geoelectrics. In particular, such localizations are expedient, because it remains questionable whether one will ever find proof of the existence of the German nuclear weapon in the archives of the former Allies, as these archives are under state control.

Numerous files are still blocked, some with periods of up to 100 years, which actually says it all. Those locations are less controllable, although of course everything is done here by the state to prevent the curious from finding something. The laws, regulations and ordinances that exist in this country and supposedly serve the (soil) monument or nature conservation are used and abused by the authorities to prevent investigations that affect the subsoil of Thuringia and other federal states. What I mean by that can currently be observed after ground radar investigations in the area of the so-called hamster, which is not too far away from the well-known Thuringian Jonastal tunnels, have revealed something unusual, which of course does not suit certain state authorities.

KOPP Online: Did you get an idea of how the Germans produced the material for the atomic bomb back then?

TM: Yes. It is an ingenious process which, if announced, would enable any Fourth World country to become nuclear-armed. It is actually clear that the Germans did not need these large-scale plants like the Americans for their Manhattan project, because they had to rely more on quality than on quantity due to a completely different raw material situation compared to the USA and the former Soviet Union.

According to his sons, US top agent Donald Richardson, known as General Eisenhower's "eye and ear", claims to have removed more than 60 kilograms of highly enriched, weapons-grade uranium from a Reichspost facility. The United States needed a huge amount of energy for this and had to build entire dams. That was not necessary in Germany, where the intelligentsia triumphed.

Finally, it should be mentioned that there is also evidence that we have been shamelessly lied to about the importance of the military training area in Ohrdruf and its surroundings for decades. The current reporting [in 2016] on an underground installation identified by radar measurements in the area of the hamster makes it clear that the public should always be persuaded that there are no underground installations apart from the Jonastal tunnels, which are actually irrelevant. That's a cheeky one

Lie, because we have a film from the 1980s that documents the opposite. We have included some stills from this film in our current book, which speak for themselves. [Excerpts from this film can also be seen on the DVD *Secret Matter German Atomic Bomb*, published by Kopp Verlag.]

KOPP Online: You describe a small A weapon test in March

1945 at the military training area in Ohrdruf. How secure is it, and what is its significance for the topic?

TM: We were made aware of the experiment by contemporary witnesses, but have not yet published all the material on it.

The Physikalisch-Technische Bundesanstalt (PTB) took soil samples there years ago and examined them, but allegedly could not find anything suspicious, but kept a back door open in their press release by writing that the sampling they carried out was only a random sample analysis, which means that other results could perhaps be brought to light in further or extended investigations. For many interested parties the topic was settled, but not for us. [See also the explanations in this book, which refer to investigations by another group of physicists.]

Contemporary witnesses claimed that the ignited charge weighed only between 100 and 140 grams, which means that only one mini-weapon was tested. If then perhaps only 50 to 70 grams, i.e. 50 percent of the charge, went into the nuclear reaction (which is still a lot), then it is difficult today to provide physical evidence for this test [but you can, if you do want, can definitely provide by means of existing analytical methods]. For comparison: According to different sources, 45 to 52 kilograms of uranium-235 were used in the Hiroshima bomb, most of which wasted, meaning that it was not included in the nuclear reaction at all. Nevertheless, today it is only possible to prove the detonation of this nuclear weapon over the Japanese city with very sensitive instruments.

Since the area of small-A weapons tests on a federal property, i.e. the military training area in Ohrdruf, we have no access there for further measurements. I don't have to ask there anymore, because years ago it was said that I was no longer allowed to enter the place (together with another person from Thuringia). Letters in which I asked for the reasons for the barring order were ignored; not a single one was answered. For me, the whole thing is indirect proof that the operators of the field have orders from above to keep the ball flat.

Anyone who thinks that we're throwing in the towel because of this is wrong. We've received a tip about another testing location that

fortunately not on a site used by the military.
We'll take care of him when the time comes.

KOPP Online: Hitler's atomic bomb is another recent example where so-called "conspiracy theories" soon became mainstream news. That was now the case with possible bomb finds in the Jonas Valley area. Can you tell us more about this?

TM: I'll be brief on that and especially on my two

refer to articles published in these days that reflect the current state of affairs. [Unfortunately, these are currently no longer available.]

Radar measurements have been made in the area of the so-called hamster and a tunnel system has been identified in which there may be large bombs which, if you look at the radar images, bear a certain resemblance to the nuclear weapons that the Americans dropped on Hiroshima and Nagasaki. The Mitteldeutscher Rundfunk (MDR) reported on May 10 [2016] in a short article spoke very factually about the subject, whereupon the mayor of Arnstadt and the responsible district administrator, apparently after a kind of crisis meeting, denied everything and spoke of speculation and imaginary claims.

A commissioned specialist company surveyed the area with the latest technology (which?) but found nothing. Oddly enough, at this point in time, people still wanted to know the exact location from those who had carried out the measurements or who had reported their results to the authorities. The affair is a farce that shows that anyone who deviates from mainstream opinion is happily vilified as conspiracy theorists or fantasists, while officials pretend to know better and be the people with perspective.

But they are the really problematic characters in this game, namely the conspiracy practitioners who want to leave everything as it is for reasons of the status quo and German *raison d'état*.

KOPP Online: Why do authorities and the media wall up when it comes to this topic? Are there current examples?

TM: The authorities are stonewalling because they are informed. At least certain people have the relevant knowledge. A few years ago I had the opportunity to meet the head of a certain agency who, in the course of the conversation, which fortunately took place in the presence of two witnesses, made it clear to me that his hands were tied, since his superior prevented him from dealing with this topic prohibited. In addition, authorities have repeatedly received the estates of certain people in recent years, which contain information that is incompatible with previous historiography and reports on very problematic secret weapon projects and locations of the German Reich in the period from 1925 to 1945. It is of course fundamentally wrong to turn to government agencies with such discounts. Bricking is done primarily to 1) avoid compromising the Americans and 2) to preserve historiography, which is that of the Allies. What happened in Thuringia is not a page of praise for the United States, nor for the German resistance, but - and I say it deliberately - the greatest betrayal in world history.

As for the media, I don't want to lump everyone together. In my opinion, there are, for example, at ZDF, at MDR and also at the daily newspaper *Thüringer Allgemeine*, honestly trying people who want to know the truth. However, they have to protect themselves on all sides, since their reputation is at stake. But those three are the exception to the rule when it comes to establishment media, forgetting the rest. But what can one expect in relation to such a complex topic? Most of the journalists who travel for the "quality media" are scaredy-cats, want to keep their jobs and write to their editors-in-chief

mouth or according to their specifications. I have dealt with many of these people over the years. There's nothing else I have to discuss with them.

KOPP Online: How does a book author break through such blockages his research?

TM: The question is easy to answer: by not taking into account the opinions of others and certainly not taking into account the politically correct writing of some would-be court correspondent. In addition, one has to look for like-minded people out there, even if this is treadmill-heavy territory, as many seem more than they really are. God's animal kingdom is just big, and you have to look at it with a certain lightness, otherwise you can't do it with the human

beings despair.

KOPP Online: A certain SS Obergruppenfuhrer Hans Rammler played a central role in your research for the book. At the beginning of 1945, according to your findings, he picked up a bomb in the Jonas Valley in Thuringia, which had a special significance. What's it all about?

TM: According to two contemporary witnesses, Hitler's secret weapons chief came to the Jonastal area to collect a nuclear weapon from an underground facility where it had been manufactured. According to eyewitness reports, this facility is located below the Sonnenberg, which is north of the area known as Hamster. Ground radar surveys have shown numerous cavities there, so the area is not uninteresting.

KOPP Online: What are the reactions from the press and readers to Her book?

TM: The readers' reactions so far have been factual-critical and cautiously friendly. We have almost always been asked

to continue our work. I haven't had any press reactions yet can register, although it might still be too early for that.

Incidentally, it goes without saying that a topic like the German atomic bomb is very polarizing; everyone has different ideas of what evidence is. We are relaxed about this, knowing that we are on a long path of knowledge and may never reach our goal. However, we allow ourselves to ask questions, point out contradictions, unknown

to document and evaluate actions. In any case, something is rotten in the state of Germany, even super lazy, when it comes to certain aspects of historiography, especially the

advanced weapons developed in the German Reich as well
relate to power generation technology.

KOPP Online: Why is the question of whether Hitler had an atomic bomb still important 70 years after the end of the war?

TM: It sounds pompous: But it's about the historical truth. The Allies' history of victory is in part manipulative, one-sided, incorrect or outright mendacious. In order to form an opinion, one must always hear both sides; However, this possibility was taken away from us by the victors of World War II, but also by those who, as establishment historians, now follow the given historical picture and call it "truth".

Fortunately, I'm not a historian who has to adhere to any guidelines or have to worry about his reputation - great advantages when it comes to the search for the truth. I allow myself to think and act freely. Apart from that, in addition to the historical truth, which was unfortunately withheld from the war generation, which in itself is enormous cheek, there is something else at stake: on the one hand, it is about removing the mask from the faces of the liars who are also active in this country and on the other hand to draw the Germans' attention to the fact that time bombs are ticking under their feet, which official bodies are ignoring in the hope that nothing will happen. [This procedure also applies to other atlases. Just think of the German poison gas grenades sunk by the Allies in the North and Baltic Seas after the war.]

But one day the secret German nuclear and wonder weapon program will speak up - perhaps only long after I've been in my grave - and show that it existed. Whether Thuringia or other parts of the country will still be habitable afterwards is a question that I don't intend to answer for once.

And whether those who think they have to come here to

A country that is said to flow with milk and honey (what a ridiculous notion), to lead an advantageous life, to do something good with it, is highly doubtful. In my opinion, you will regret this step.

KOPP Online: In your current book you indicate that there were more far-reaching, post-nuclear developments in addition to nuclear weapons. Do you want to say something?

TM: Maybe just this much: In our opinion, the Ent

development of nuclear weapons based on the principle of fission was probably completed by 1943 at the latest. A few years ago we believed that such bombs would have taken more time to develop, but even we sometimes have to revise our positions in the light of new clues and information. Then it was on to developing fusion weapons, which we believe the test at Ohrdruf Training Area had something to do with these fusion weapons in development. Irrespective of this, there were also teams that researched in completely different directions when it came to so-called weapons of mass destruction. One of them developed a super explosive called RADgUM that eclipsed everything that had been tested up to that point.

In addition, certain structures dealt with neuarti
gen propellants and systems, for example with "heavy air", which made it possible to send a missile with a few decilitres of tank content once around the world. I want to end here because I don't think there's much point in talking about things that many would relegate to the realm of magic if you tried to elaborate on them. Especially as long as it is not accepted that the German nuclear weapon existed. In addition, one would have to consider the fact that certain German structures used their knowledge advantage after the war to continue working in South America, for example - with astonishing consequences.

Secret AWO: the Germans

Second Generation Miracle Weapons

Public interest in the Jonastal in Thuringia or the AWO area and its "secret" has been unbroken for years.

Originally, it was assumed that at the end of the war only one Führer headquarters would be built here. However, the ever-growing number of facts, indications and evidence documents that there was more to the secret project known as »SIII«, which thousands of prisoners had to pay for with their lives, than just a last shelter for Hitler and his followers. In this area, top-secret underground facilities worked on the "miracle weapons of the second generation" with which the United States of America, among other things, was to be attacked and with which Hitler intended to achieve the final victory he repeatedly propagated.

We offer those interested in contemporary history the opportunity to experience history up close in group tours during a one-day tour. Visit the AWO or Jonastal area under expert guidance, learn more about what happened in this region during the Second World War and be informed about the current status of research.

Zeitzeugenberichte, Dokumente und Analysen vor Ort liefern weitere Belege für die Kernwaffen- forschung des Dritten Reiches

Seit über 20 Jahren beschäftigen sich Edgar Mayer und Thomas Mehner mit der Frage: Verfügte das Dritte Reich über die Atombombe? Die bisherige Bilanz der Autoren: Deutsche Wissenschaftler haben in den 1930er- und 1940er-Jahren sowohl die Bombe als auch den Zünder und die Produktionsanlagen zur Anreicherung von spaltbarem Material entwickelt. Deutsche Ingenieure bauten Trägerraketen zum Transport der Bombe und arbeiteten bereits an der zweiten Generation der Kernwaffen.

Reinhard Gehlen wusste von dem Atombombentest in Thüringen

In diesem Buch liefern die Autoren dafür neue Indizien und Beweise. So belegt ein Atombombentest beim thüringischen Ohrdruf die These von Mayer und Mehner. Er wird jetzt von bekannten Zeugen bestätigt. Nach neuesten Erkenntnissen wusste der hohe Nazi-General und spätere Präsident des BND Reinhard Gehlen von dem Test. Denn sein Bruder beobachtete die Explosion. Weitere Indizien liefert ein grausamer Versuch in der Nähe von Auschwitz, bei dem 20000 Juden durch die Detonation zweier Nuklearwaffen getötet wurden. Ein Zeitzeugenbericht schildert die schockierenden Details dieses Verbrechens.

- Das System im Panikmodus? Seltsame Radarechos im Bereich des »Hamsters« (Jonastal) – und wie man sie behördlicherseits wegerklärt.
- Der Kleinstatomtest auf dem Truppenübungsplatz Ohrdruf Anfang März 1945. Die Ergebnisse der Physikalisch-Technischen Bundesanstalt – und die ganz anders lautenden einer weiteren Untersuchung.
- Was wusste der spätere BND-Chef General Reinhard Gehlen von dem thüringischen Atomtest?
- Die Reaktoren im Kienberg bei Luisenthal und das 1941 von Karl Wirtz angemeldete Reaktorpatent, das jahrzehntelang »verschwunden« war.
- Der Fall »Stadttilm«: Kann man Atomwaffen in einem Stahlschrank unterbringen?
- Der mörderische Bombenangriff auf das Dorf Geistingen (heute Hennef, NRW) und was die Alliierten wirklich treffen wollten: die im Umfeld befindliche unterirdische SS-Denkfabrik.
- Update: das Auschwitz-Experiment. Albert Speer, die IG Farben und Justice Robert H. Jacksons Frage beim Prozess gegen die Hauptkriegsverbrecher in Nürnberg zu einer Waffe, die 20000 Menschen verschwinden ließ.
- Geheime Experimente im Böhmischemährischen: postatomare Waffensysteme und der technologische Durchbruch bei der Lösung des Energieproblems. Katalyse, »Theophil« und sich selbsttätig aufladende Batterien.

Hitlers Atombombe: die neuesten Fakten, Indizien und Beweise

Die Autoren thematisieren einmal mehr die Frage, warum Hitler die Bombe im Krieg nicht einsetzte. Die Antwort: Die Alliierten hatten für diesen Fall gedroht, Millionen Deutsche mit Giftgas zu töten. Neue Beweise dafür lassen sich aus einem Zwischenfall im Hafen von Bari ableiten, über den einst sogar *Der Spiegel* berichtete. In der italienischen Stadt wurden große Mengen Giftgas für einen Angriff auf Deutschland per Schiff angelandet.

Die Wahrheit wird systematisch verschwiegen

Wie die Autoren zeigen, sollen all diese Tatsachen jedoch nicht an die Öffentlichkeit gelangen: Sie selbst wurden bei ihren Recherchen behindert und sogar schon mit dem Tod bedroht. Denn die offizielle Geschichtsschreibung darf nicht infrage gestellt werden. Vertuscht werden soll insbesondere, dass die Amerikaner nur durch Aneignung der deutschen Kernwaffentechnik so schnell zur Atommacht wurden. Auch ihre Verbrechen bei der »Requirierung« der Technologie dürfen nicht bekannt werden. Doch wie Edgar Mayer und Thomas Mehner deutlich machen: Es gilt, die Wahrheit ans Licht zu bringen. Nicht zuletzt, weil dahinterrotende Atombomben aus den 1940er-Jahren in deutschem Boden vergraben sind. Aber auch, weil die Enthüllung der Forschungsarbeit des Dritten Reiches das heutige Energieproblem lösen könnte. Denn die damaligen Wissenschaftler entwickelten revolutionäre und umweltfreundliche Konzepte zur Energieerzeugung.
